## PREFACE.

---

A LARGE number of the Theorems usually presented in textbooks of Geometry are unimportant in themselves and in no way connected with the subsequent Propositions. By spending too much time on things of little importance, the pupil is frequently unable to advance to those of the highest practical value. In this work, although no important Theorem has been omitted, not one has been introduced that is not necessary to the demonstration of the last Theorem of the five Books, namely, that in relation to the volume of a sphere. Thus the whole constitutes a single Theorem, without an unnecessary link in the chain of reasoning.

These five Books, including Ratio and Proportion, are presented in eighty-one Propositions, covering only seventy pages. This brevity has been attained by omitting all unconnected propositions, and adopting those definitions and demonstrations that lead by the shortest path to the desired end. At the close of each Book are Practical Questions, serving partly as a review, partly as practical applications of the principles of the Book, and partly as suggestions to the teacher. As those who have not had experience in discovering methods of demonstration have but little real acquaintance with Geometry, there have been added to each Book, for those who have the time and the ability, Theorems for original demonstration. These Exercises, with different methods of proving propositions already demon-

strated, include those that are usually inserted, but whose demonstration in this work has been omitted. In some of these Exercises references are given to the necessary propositions; in some suggestions are made; and in a few cases the figure is constructed as the proof will require.

A sixth Book of Problems of Construction is added, which is followed by Problems for the pupil to solve. This Book, or any part of it, if thought best, can be taken immediately after completing Book III.

The Trigonometry is accompanied by the necessary Tables and their explanation, and presents in only fifty-two pages all the essential principles of Plane Trigonometry given by both the Geometrical and Analytical methods, and so arranged that either can be studied independently of the other. In fourteen more pages is given the application of these principles to the measurement of heights and distances and the determination of areas.

W. F. B.

# PLANE GEOMETRY.

## INTRODUCTORY DEFINITIONS.

1. **Mathematics** is the science of quantity.
2. **Quantity** is that which can be measured ; as distance, time, weight.
3. **Geometry** is that branch of mathematics which treats of the properties of extension.
4. **Extension** has one or more of the three dimensions, length, breadth, or thickness.
5. A **Point** has position, but not magnitude.
6. A **Line** has length, without breadth or thickness.
7. A **Straight Line** is one whose direction is the same throughout ; as  $A \text{---} B$ .  
A straight line has two directions exactly opposite, of which either may be assumed as its direction.  
The word *line*, used alone in this book, means a straight line.
8. **Corollary.** Two points of a line determine its position.
9. A **Curved Line** is one whose direction is constantly changing ; as  $C \curvearrowright D$ .
10. A **Surface** has length and breadth, but no thickness.

**11.** A **Plane** is such a surface that a straight line joining any two of its points is wholly in the surface.

**12.** A **Solid** has length, breadth, and thickness.

**13.** *Scholium.* The boundaries of solids are surfaces; of surfaces, lines; the ends of lines are points.

**14.** A **Theorem** is something to be proved.

**15.** A **Problem** is something to be done.

**16.** A **Proposition** is either a theorem or a problem.

**17.** A **Corollary** is an inference from a proposition or statement.

**18.** A **Scholium** is a remark appended to a proposition.

**19.** An **Hypothesis** is a supposition in the statement of a proposition, or in the course of a demonstration.

**20.** An **Axiom** is a self-evident truth.

### AXIOMS.

1. If equals are added to equals, the sums are equal.
2. If equals are subtracted from equals, the remainders are equal.
3. If equals are multiplied by equals, the products are equal.
4. If equals are divided by equals, the quotients are equal.
5. Like powers and like roots of equals are equal.
6. The whole of a magnitude is greater than any of its parts.
7. The whole of a magnitude is equal to the sum of all its parts.
8. Magnitudes respectively equal to the same magnitude are equal to each other.
9. A straight line is the shortest distance between two points.

## BOOK I.

---

### ANGLES, LINES, POLYGONS.

#### ANGLES.

#### DEFINITIONS.

**1.** An **Angle** is the difference in direction of two lines.

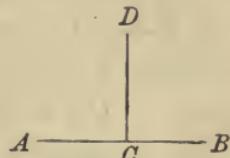

If the lines meet, the point of meeting, *B*, is called the *vertex*; and the lines *A B*, *B C*,

the *sides* of the angle.

If there is but one angle, it can be designated by the letter at its vertex, as the angle *B*; but when a number of angles have the same vertex, each angle is designated by three letters, the middle letter showing the vertex, and the other two with the middle letter the sides; as the angle *A B C*.

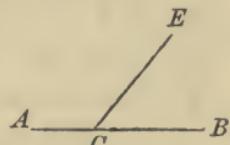

**2.** If a straight line meets another so as to make the adjacent angles equal, each of these angles is a *right angle*; and the two lines are perpendicular to each other. Thus, *A C D* and *D C B*, being equal, are right angles, and *A B* and *B C* are perpendicular to each other.

**3.** An **Acute Angle** is less than a right angle; as *E C B*.

**4.** An **Obtuse Angle** is greater than a right angle; as *A C E*.

Acute and obtuse angles are called oblique angles.

**5.** The **Complement** of an angle is a right angle minus the given angle. Thus (Fig. in Art. 7), the complement of  $ACD$  is  $ACF - ACD = DCF$ .

**6.** The **Supplement** of an angle is two right angles minus the given angle. Thus (Fig. Art. 7), the supplement of  $ACD$  is  $(ACF + FCB) - ACD = DCB$ .

### THEOREM I.

**7.** *The sum of all the angles formed at a point on one side of a straight line, in the same plane, is equal to two right angles.*

Let  $DC$  and  $EC$  meet the straight line  $AB$  at the point  $C$ ; then  $ACD + DCE + ECB =$  two right angles.

At  $C$  erect the perpendicular,  $CF$ ; then it is evident that

$$\begin{aligned} ACD + DCE + ECB &= ACD + DCF + FCE + ECB \\ &= ACF + FCB = \text{two right angles.} \end{aligned}$$

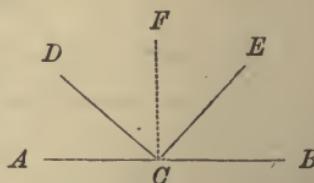

**8. Corollary 1.** If only two angles are formed, each is the supplement of the other.

For by the theorem,

$$ACD + DCB = \text{two right angles};$$

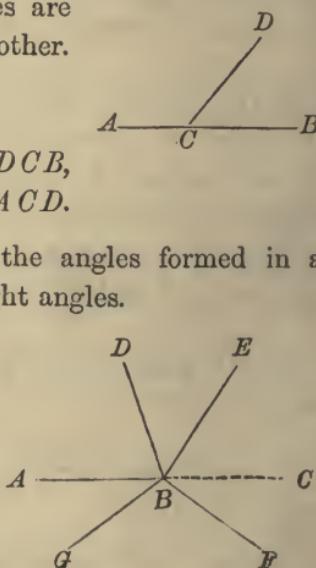

therefore  $ACD = \text{two right angles} - DCB$ ,

or  $DCB = \text{two right angles} - ACD$ .

**9. Corollary 2.** The sum of all the angles formed in a plane about a point is equal to four right angles.

Let the angles  $ABD, DBE, EBF, FBG, GB A$ , be formed in the same plane about the point  $B$ . Produce  $AB$ ; then the sum of the angles above the line  $AC$  is equal to two right angles; and also, the sum of the angles below the line  $AC$  is equal

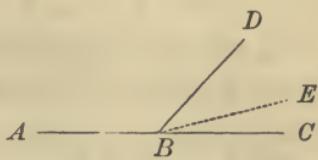

to two right angles (7)\*; therefore the sum of all the angles at the point  $B$  is equal to four right angles.

## THEOREM II.

**10.** *If at a point in a straight line two other straight lines upon opposite sides of it make the sum of the adjacent angles equal to two right angles, these two lines form a straight line.*

Let the straight line  $DB$  meet the two lines,  $AB$ ,  $BC$ , so as to make  $A BD + D BC =$  two right angles : then  $AB$  and  $BC$  form a straight line.

For if  $AB$  and  $BC$  do not form a straight line, draw  $BE$  so that  $AB$  and  $BE$  shall form a straight line ; then

$$A BD + D BE = \text{two right angles (7)};$$

but by hypothesis,

$$A BD + D BC = \text{two right angles} ;$$

therefore

$$D BE = D BC$$

the part equal to the whole, which is absurd (Axiom 6) ; therefore  $AB$  and  $BC$  form a straight line.

## THEOREM III.

**11.** *If two straight lines cut each other, the opposite, or vertical, angles are equal.*

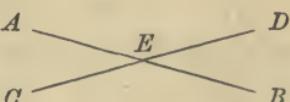

Let the two lines,  $AB$ ,  $CD$ , cut each other at  $E$ ; then  $A EC = D EB$ .

For  $A ED$  is the supplement of both  $A EC$  and  $D EB$  (8); therefore

$$A EC = D EB$$

In the same way it may be proved that

$$A ED = C EB$$

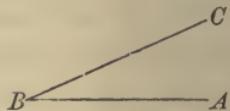

\* The figures alone refer to an article in the same Book ; in referring to an article in another Book the number of the Book is prefixed.

## THEOREM IV.

**12.** *Two angles whose sides have the same or opposite directions are equal.*

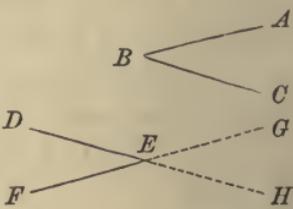

1st. Let  $BA$  and  $BC$ , including the angle  $B$ , have respectively the same direction as  $ED$  and  $EF$ , including the angle  $E$ ; then angle  $B =$  angle  $E$ .

For since  $BA$  has the same direction as  $ED$ , and  $BC$  the same as  $EF$ , the difference of direction of  $BA$  and  $BC$  must be the same as the difference of direction of  $ED$  and  $EF$ ; that is, angle  $B =$  angle  $E$ .

2d. Let  $BA$  and  $BC$ , including the angle  $B$ , have respectively opposite directions to  $EF$  and  $ED$ , including the angle  $E$ ; then angle  $B =$  angle  $E$ .

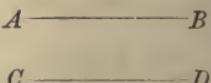

Produce  $DE$  and  $FE$  so as to form the angle  $GEH$ ; then (11)

$$GEH = DEF$$

and  $GEH = ABC$  by the first part of this proposition; therefore angle  $B =$  angle  $E$ .

## PARALLEL LINES.

**13.** *Definition.* Parallel Lines are such as have the same direction ; as  $AB$  and  $CD$ .

**14.** *Corollary.* Parallel lines can never meet. For, since parallel lines have the same direction, if they coincided at one point, they would coincide throughout and form one and the same straight line.

Conversely, straight lines in the same plane that never meet, however far produced, are parallel. For if they never meet they cannot be approaching in either direction, that is, they must have the same direction.

**15. Axiom.** Two lines parallel to a third are parallel to each other.

**16. Definition.** When parallel lines are cut by a third, the angles without the parallels are called *external*; those within, *internal*; thus,  $AGE, EGB, CHF, FHD$  are *external angles*;  $AGH, BGH, GHC, GHG$  are *internal angles*. Two internal angles on the same side of the secant, or cutting line, are called *internal angles on the same side*; as  $AGH$  and  $GHC$ , or  $BGH$  and  $GHD$ . Two internal angles on opposite sides of the secant, and not adjacent, are called *alternate internal angles*; as  $AGH$  and  $GHD$ , or  $BGH$  and  $GHC$ .

Two angles, one external, one internal, on the same side of the secant, and not adjacent, are called *opposite external and internal angles*; as  $EGB$  and  $GHC$ , or  $EGB$  and  $GHD$ .

### THEOREM V.

**17. If a straight line cut two parallel lines,**

1st. *The opposite external and internal angles are equal.*

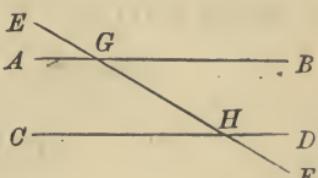

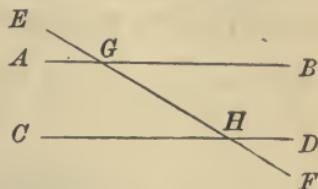

2d. *The alternate internal angles are equal.*

3d. *The internal angles on the same side are supplements of each other.*

Let  $EF$  cut the two parallels  $AB$  and  $CD$ ; then

1st. The opposite external and internal angles,  $EGB$  and  $GHC$ , or  $EGB$  and  $GHD$ , are equal, since their sides have respectively the same directions (12).

2d. The alternate internal angles,  $AGH$  and  $GHD$ , or  $BGH$  and  $GHC$ , are equal, since their sides have opposite directions (12).

3d. The internal angles on the same side,  $AGH$  and  $GHD$ , or  $BGH$  and  $GHD$ , are supplements of each other; for  $AGH$  is the supplement of  $AGE$  (8), which has just been proved equal to  $GHC$ . In the same way it may be proved that  $BGH$  and  $GHD$  are supplements of each other.

### THEOREM VI.

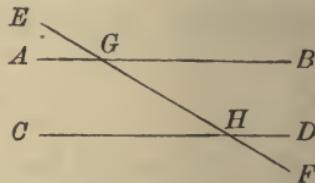

#### CONVERSE OF THEOREM V.

**18.** *If a straight line cut two other straight lines in the same plane, these two lines are parallel,*

- 1st. *If the opposite external and internal angles are equal.*
- 2d. *If the alternate internal angles are equal.*
- 3d. *If the internal angles on the same side are supplements of each other.*

Let  $EF$  cut the two lines  $AB$  and  $CD$  so as to make  $EGB = GHD$ , or  $AGH = GHD$ , or  $BGH$  and  $GHD$  supplements of each other; then  $AB$  is parallel to  $CD$ .

For, if through the point  $G$  a line is drawn parallel to  $CD$ , it will make the opposite external and internal angles equal, and the alternate internal angles equal, and the internal angles on the same side supplements of each other (17); therefore it must coincide with  $AB$ ; that is,  $AB$  is parallel to  $CD$ .

### PLANE FIGURES.

#### DEFINITIONS.

**19.** **A Plane Figure** is a portion of a plane bounded by lines either straight or curved.

When the bounding lines are straight, the figure is a *polygon*, and the sum of the bounding lines is the *perimeter*.

**20.** An **Equilateral Polygon** is one whose sides are equal each to each.

**21.** An **Equiangular Polygon** is one whose angles are equal each to each.

**22.** Polygons whose sides are respectively equal are *mutually equilateral*.

**23.** Polygons whose angles are respectively equal are *mutually equiangular*.

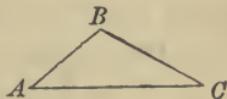

Two equal sides, or two equal angles, one in each polygon, similarly situated, are called *homologous* sides, or angles.

**24.** **Equal Polygons** are those which, being applied to each other, exactly coincide.

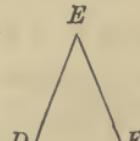

**25.** Of Polygons, the simplest has three sides, and is called a *triangle*; one of four sides is called a *quadrilateral*; one of five, a *pentagon*; one of six, a *hexagon*; one of eight, an *octagon*; one of ten, a *decagon*.

### TRIANGLES.

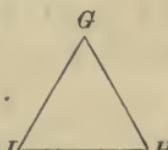

**26.** A **Scalene Triangle** is one which has no two of its sides equal; as  $A B C$ .

**27.** An **Isosceles Triangle** is one which has two of its sides equal; as  $D E F$ .

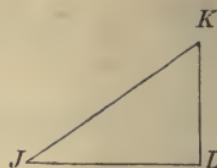

**28.** An **Equilateral Triangle** is one whose sides are all equal; as  $I G H$ .

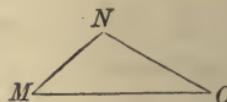

**29.** A **Right Triangle** is one which has a right angle ; as  $JKL$ .

The side opposite the right angle is called the *hypotenuse*.

**30.** An **Obtuse-angled Triangle** is one which has an obtuse angle ; as  $MNO$ .

**31.** An **Acute-angled Triangle** is one whose angles are all acute ; as  $DEF$ .

Acute and obtuse-angled triangles are called *oblique-angled triangles*.

**32.** The side upon which any polygon is supposed to stand is generally called its *base*; but in an isosceles triangle, as  $DEF$ , in which  $DE = EF$ , the third side  $DF$  is always considered the base.

### THEOREM VII.

**33.** *The sum of the angles of a triangle is equal to two right angles.*

Let  $ABC$  be a triangle ; the sum of its three angles,  $A$ ,  $B$ ,  $C$ , is equal to two right angles.

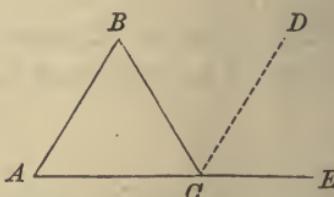

Produce  $AC$ , and draw  $CD$  parallel to  $AB$ ; then  $DCE = A$ , being external internal angles (17);

$BCD = B$ , being alternate internal angles (17); hence

$$DCE + BCD + BCA = A + B + BCA$$

but  $DCE + BCD + BCA = \text{two right angles}$  (7) ;

therefore  $A + B + BCA = \text{two right angles}.$

**34.** *Cor. 1.* If two angles of a triangle are known, the third can be found by subtracting their sum from two right angles.

**35.** *Cor. 2.* If two triangles have two angles of the one respectively equal to two angles of the other, the remaining angles are equal.

**36.** *Cor. 3.* In a triangle there can be but one right angle, or one obtuse angle.

**37.** *Cor. 4.* In a right triangle the sum of the two acute angles is equal to a right angle.

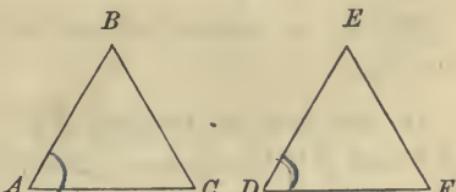

**38.** *Cor. 5.* Each angle of an equiangular triangle is equal to one third of two right angles, or two thirds of one right angle.

**39.** *Cor. 6.* If any side of a triangle is produced, the exterior angle is equal to the sum of the two interior and opposite.

### THEOREM VIII.

**40.** *If two triangles have two sides and the included angle of the one respectively equal to two sides and the included angle of the other, the two triangles are equal in all respects.*

In the triangles  $A B C$ ,  $D E F$ , let the side  $A B$  equal  $D E$ ,  $A C$  equal  $D F$ , and the angle  $A$  equal the angle  $D$ ; then the triangle  $A B C$  is equal in all respects to the triangle  $D E F$ .

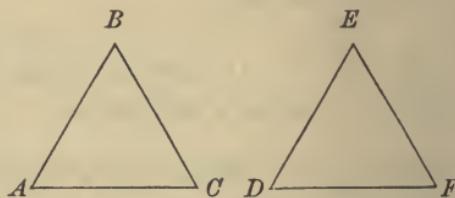

Place the side  $A B$  on its equal  $D E$ , with the point  $A$  on the point  $D$ , the point  $B$  will be on the point  $E$ , as  $A B$  is equal to  $D E$ ; then, as the angle  $A$  is equal to the angle  $D$ ,  $A C$  will take the direction  $D F$ , and as  $A C$  is equal to  $D F$ , the point  $C$  will be on the point  $F$ ; and  $B C$  will coincide with  $E F$ . Therefore the two triangles coincide, and are equal in all respects.

## THEOREM IX.

**41.** If two triangles have two angles and the included side of the one respectively equal to two angles and the included side of the other, the two triangles are equal in all respects.

In the triangles  $A B C$  and  $D E F$ , let the angle  $A$  equal the angle  $D$ , the angle  $C$  equal the angle  $F$ , and the side  $A C$  equal  $D F$ ; then the triangle

$A B C$  is equal in all respects to the triangle  $D E F$ .

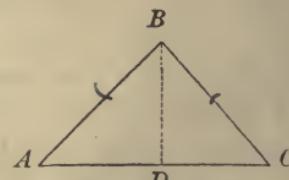

Place the side  $A C$  on its equal  $D F$ , with the point  $A$  on the point  $D$ , the point  $C$  will be on the point  $F$ , as  $A C$  is equal to  $D F$ ; then, as the angle  $A$  is equal to the angle  $D$ ,  $A B$  will take the direction  $D E$ ; and as the angle  $C$  is equal to the angle  $F$ ,  $C B$  will take the direction  $F E$ ; and the point  $B$  falling at once in each of the lines  $D E$  and  $F E$  must be at their point of intersection  $E$ . Therefore the two triangles coincide, and are equal in all respects.

## THEOREM X.

**42.** In an isosceles triangle the angles opposite the equal sides are equal.

In the isosceles triangle  $A B C$  let  $A B$  and  $B C$  be the equal sides; then the angle  $A$  is equal to the angle  $C$ .

Bisect the angle  $A B C$  by the line  $B D$ ; then the triangles  $A B D$  and  $B C D$  are equal, since they have the two sides  $A B$ ,  $B D$ , and the included angle  $A B D$  equal respectively to  $B C$ ,  $B D$ , and the included angle  $D B C$  (40); therefore the angle  $A = C$ .

**43. Cor. 1.** From the equality of the triangles  $A B D$  and  $B C D$ ,  $AD = DC$ , and the angle  $ADB = BDC$ ; that is, the

line bisecting the angle opposite the base of an isosceles triangle bisects the base at right angles and also bisects the triangle; also the line drawn from the vertex perpendicular to the base of an isosceles triangle bisects the base, the vertical angle, and the triangle. And, conversely, the perpendicular bisecting the base of an isosceles triangle bisects the angle opposite, and also the triangle.

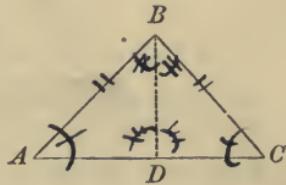

**44. Cor. 2.** An equilateral triangle is equiangular.

### THEOREM XI.

**45.** *If two angles of a triangle are equal, the sides opposite are also equal.*

In the triangle  $A B C$  let the angle  $A$  equal the angle  $C$ ; then  $A B$  is equal to  $B C$ .

Bisect the angle  $A B C$  by the line  $B D$ . Now by hypothesis the angle  $A$  is equal to the angle  $C$ , and by construction the angle  $A B D$  is equal to the angle  $D B C$ ; therefore (35) the angle  $A D B$  is equal to the angle  $B D C$ ; and the two triangles  $A B D$ ,  $D B C$ , having the side  $B D$  common and the angles including  $B D$  respectively equal, are equal (41) in all respects; therefore  $A B = B C$ .

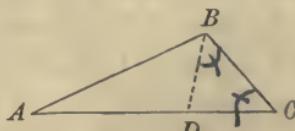

**46. Corollary.** An equiangular triangle is equilateral.

### THEOREM XII.

**47.** *The greater side of a triangle is opposite the greater angle; and, conversely, the greater angle is opposite the greater side.*

In the triangle  $A B C$  let  $B$  be greater than  $C$ ; then the side  $A C$  is greater than  $A B$ .

At the point  $B$  make the angle  $C B D$  equal to the angle  $C$ ;

then (45)  $DB = DC$

and  $AC = AD + DC = AD + DB$

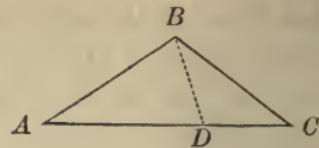

But (Axiom 9)

$$AD + DB > AB$$

therefore

$$AC > AB$$

*Conversely.* Let  $AC > AB$ ; then the angle  $ABC > C$ . Cut off  $AD = AB$  and join  $BD$ ; then as  $AD = AB$ , the angle  $ABD = ADB$  (42); and  $ADB > C$  (39); therefore  $ABD > C$ ; but  $ABC > ABD$ ; therefore  $ABC > C$ .

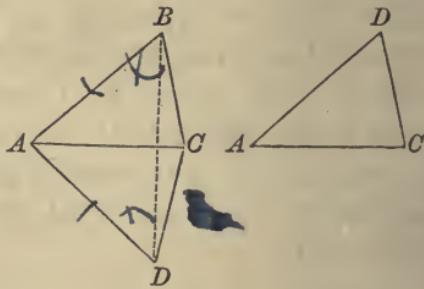

### THEOREM XIII.

**48.** *Two triangles mutually equilateral are equal in all respects.*

Let the triangle  $ABC$  have  $AB, BC, CA$  respectively equal to  $AD, DC, CA$  of the triangle  $ADC$ ; then  $ABC$  is equal in all respects to  $ADC$ .

Place the triangle  $ADC$  so that the base  $AC$  will coincide with its equal  $AC$ , but so that the vertex  $D$  will be on the side of  $AC$ , opposite to  $B$ . Join  $BD$ . Since by hypothesis  $AB = AD$ ,  $ABD$  is an isosceles triangle; and the angle  $ABD = ADB$  (42); also, since  $BC = CD$ ,  $BCD$  is an isosceles triangle; and the angle  $DBC = CDB$ ; therefore the whole angle  $ABC = ADC$ ; therefore the triangles  $ABC$  and  $ADC$ , having two sides and the included angle of the one equal to two sides and the included angle of the other, are equal (40).

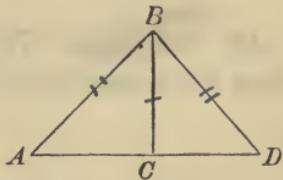

**49. Scholium.** In equal triangles the equal angles are opposite the equal sides.

#### THEOREM XIV.

**50.** Two right triangles having the hypothenuse and a side of the one respectively equal to the hypothenuse and a side of the other are equal in all respects.

Let  $A B C$  have the hypothenuse  $A B$  and the side  $B C$  equal to the hypothenuse  $B D$  and the side  $B C$  of  $B D C$ ; then are the two triangles equal in all respects.

Place the triangle  $B D C$  so that the side  $B C$  will coincide with its equal  $B C$ , then  $C D$  will be in the same straight line with  $A C$  (10). An isosceles triangle  $A B D$  is thus formed, and  $B C$  being perpendicular to the base divides the triangle into the two equal triangles  $A B C$  and  $B D C$  (43).

#### THEOREM XV.

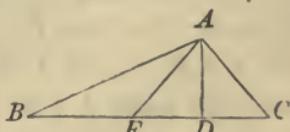

**51.** If from a point without a straight line a perpendicular and oblique lines be drawn to this line,

- 1st. The perpendicular is shorter than any oblique line.
- 2d. Any two oblique lines equally distant from the perpendicular are equal.

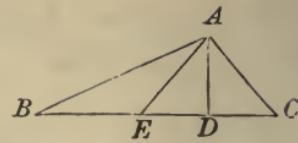

3d. Of two oblique lines the more remote is the greater.

Let  $A$  be the given point,  $B C$  the given line,  $A D$  the perpendicular, and  $A E, A B, A C$  oblique lines.

1st. In the triangle  $A D E$ , the angle  $A D E$  being a right angle is greater than the angle  $A E D$ ; therefore  $A D < A E$  (47).

2d. If  $DE = DC$ ; then the two triangles  $ADE$  and  $ADC$ , having two sides  $AD, DE$ , and the included angle  $ADE$  respectively equal to the two sides  $AD, DC$ , and the included angle  $ADC$ , are equal (40), and  $AE$  is equal to  $AC$ .

3d. If  $DB > DE$ ; then, as  $ADE$  is a right angle,  $AEB$  is acute; hence  $AEB$  is obtuse, and must therefore be greater than  $ABE$  (36); hence  $AB > AE$  (47).

**52. Corollary.** Two equal oblique lines are equally distant from the perpendicular.

#### THEOREM XVI.

**53.** *If at the middle of a straight line a perpendicular is drawn,*

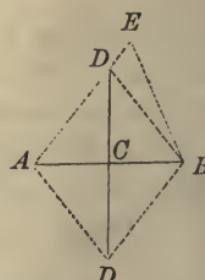

1st. *Any point in the perpendicular is equally distant from the extremities of the line.*

2d. *Any point without the perpendicular is unequally distant from the same extremities.*

Let  $CD$  be the perpendicular at the middle of the line  $AB$ ; then

1st. Let  $D$  be any point in the perpendicular; draw  $DA$  and  $DB$ . Since  $CA = CB$ ,  $DA = DB$  (51).

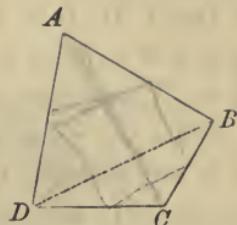

2d. Let  $E$  be any point without the perpendicular; draw  $EA$  and  $EB$ , and from the point  $D$ , where  $EA$  cuts  $DC$ , draw  $DB$ . The angle  $ABE > ABD = BAD$ ; hence, in the triangle  $AEB$  since the angle  $ABE > BAE$ ,  $EA > EB$  (47).

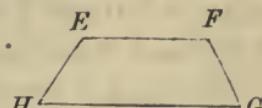

## QUADRILATERALS.

## DEFINITIONS.

**54.** A **Trapezium** is a quadrilateral which has no two of its sides parallel ; as  $A B C D$ .

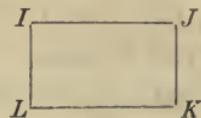

**55.** A **Trapezoid** is a quadrilateral which has only two of its sides parallel ; as  $E F G H$ .

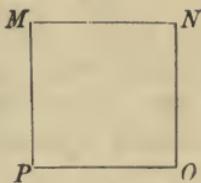

**56.** A **Parallelogram** is a quadrilateral whose opposite sides are parallel ; as  $I J K L$ , or  $M N O P$ , or  $Q R S T$ , or  $U V W X$ .

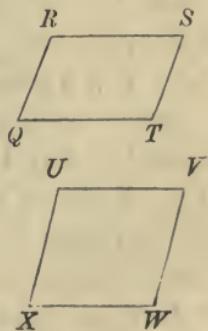

**57.** A **Rectangle** is a right-angled parallelogram ; as  $I J K L$ .

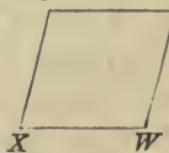

**58.** A **Square** is an equilateral rectangle ; as  $M N O P$ .

**59.** A **Rhomboïd** is an oblique-angled parallelogram ; as  $Q R S T$ .

**60.** A **Rhombus** is an equilateral rhomboid ; as  $U V W X$ .

**61.** A **Diagonal** is a line joining the vertices of two angles not adjacent ; as  $D B$ .

## THEOREM XVII.

**62.** *In a parallelogram the opposite sides are equal, and the opposite angles are equal.*

Let  $A B C D$  be a parallelogram; then will  $A B = D C, B C = A D$ , the angle  $A = C$ , and  $B = D$ .

Draw the diagonal  $B D$ . As  $B C$  and  $A D$  are parallel, the alternate angles  $C B D$  and  $B D A$  are equal (17); and as  $A B$  and  $D C$  are parallel, the alternate angles  $A B D$  and  $B D C$  are equal; therefore the two triangles  $A B D$  and  $B D C$ , having the two angles equal, and the included side  $B D$  common, are equal (41); and the sides opposite the equal angles are equal, viz. :  $A B = D C$  and  $B C = A D$ ; also the angle  $A = C$ , and the angle

$$A B C = A B D + D B C = B D C + B D A = A D C$$

**63.** *Cor.* 1. The diagonal divides a parallelogram into two equal triangles.

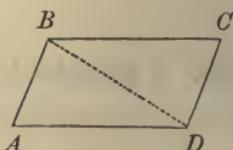

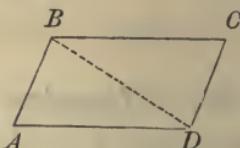

**64.** *Cor.* 2. Parallels included between parallels are equal.

## THEOREM XVIII.

**65.** *If two sides of a quadrilateral are equal and parallel, the figure is a parallelogram.*

Let  $A B C D$  be a quadrilateral having  $B C$  equal and parallel to  $A D$ ; then  $A B C D$  is a parallelogram.

Draw the diagonal  $B D$ . As  $B C$  is parallel to  $A D$ , the alternate angles  $C B D$  and  $B D A$  are equal (17); therefore the two triangles  $C B D$  and  $B D A$ , having the two sides  $C B, B D$ , and the included angle  $C B D$  respectively equal to the two sides  $A D, D B$ , and the included angle  $A D B$ , are equal (40), and the alternate angles  $A B D$  and  $B D C$  are equal; therefore  $A B$  is parallel to  $D C$  (18), and  $A B C D$  is a parallelogram.

## THEORÉM XIX.

**66.** *The line joining the middle points of the two sides of a trapezoid which are not parallel is parallel to the two parallel sides, and equal to half their sum.*

Let  $E F$  join the middle points of the sides  $A B$  and  $C D$ , which are not parallel, of the trapezoid  $A B C D$ ; then

1st.  $E F$  is parallel to  $B C$  and  $A D$ . Through  $F$  draw  $G H$  parallel to  $B A$ , meeting  $A D$  produced in  $H$ . The angles  $G F C$  and  $D F H$  are equal (11); also the angles  $G C F$  and  $F D H$  (17); and the side  $C F$  is equal to  $F D$ ; therefore the triangles  $G F C$  and  $D F H$  are equal (41), and

$$G F = F H = \frac{1}{2} G H$$

But as  $A B G H$  is a parallelogram,  $G H = B A$  (62); therefore

$$F H = \frac{1}{2} B A = A E$$

therefore  $A E F H$  is a parallelogram (65), and  $E F$  is parallel to  $A D$ , and therefore also to  $B C$ .

2d.  $E F = \frac{1}{2} (A D + B C)$

For as  $A E F H$  and  $E B G F$  are parallelograms

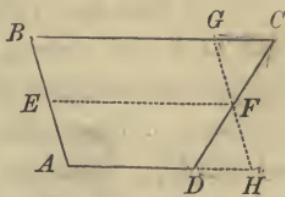

$$E F = A H = A D + D H$$

and also  $E F = B G = B C - G C$

Now, as the two triangles  $G F C$  and  $D F H$  are equal,  $G C = D H$ ; therefore, if we add the two equations, we shall have

$$2 E F = A D + B C$$

or  $E F = \frac{1}{2} (A D + B C)$

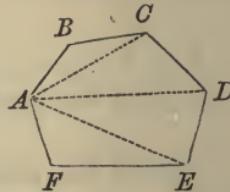

## THEOREM XX.

**67.** *The sum of the interior angles of a polygon is equal to twice as many right angles as it has sides minus two.*

Let  $A B C D E F$  be the given polygon ; the sum of all the interior angles  $A, B, C, D, E, F$ , is equal to twice as many right angles as the figure has sides minus two.

For if from any vertex  $A$ , diagonals  $A C, A D, A E$ , are drawn, the polygon will be divided into as many triangles as it has sides minus two ; and the sum of the angles of each triangle is equal to two right angles (33) ; therefore the sum of the angles of all the triangles, that is, the sum of the interior angles of the polygon, is equal to twice as many right angles as the polygon has sides minus two.

## PRACTICAL QUESTIONS.

1. Do two lines that do not meet form an angle with each other ? Two lines not in the same plane ?
2. Does the magnitude of an angle depend upon the length of its sides ?
3. If a right angle is  $90^\circ$ , what is the complement of an angle of  $27^\circ$  ? of  $51^\circ$  ? of  $91^\circ$  ? of  $153^\circ$  ? What is the supplement of an angle of  $13^\circ$  ? of  $83^\circ$  ? of  $97^\circ$  ? of  $217^\circ$  ?
4. If three of four angles formed at a point on the same side of a straight line, in the same plane, contain respectively  $15^\circ, 27^\circ$ , and  $99^\circ$ , how many degrees does the fourth angle contain ?
5. If five of six angles formed in a plane about a point are respectively  $11^\circ, 53^\circ, 74^\circ, 19^\circ$ , and  $117^\circ$ , how many degrees are there in the sixth angle ?
6. On opposite sides of a line  $AB$  are two lines making with  $AB$ , at the point  $A$ , the first an angle of  $29^\circ$ , and the second an angle of  $61^\circ$ ; how are these two lines related ?

7. Can two polygons, each not equilateral, be *mutually* equilateral ? *(red)*
8. Can two polygons, each not equiangular, be *mutually* equiangular ? *(no)*
9. If two angles of a triangle are respectively  $32^\circ$  and  $43^\circ$ , how many degrees are there in the remaining angle ?
10. If one acute angle of a right triangle is  $24^\circ$ , how many degrees are there in the other acute angle ?
11. How many degrees in each angle of an equiangular triangle ?
12. How many degrees in each angle at the base of an isosceles triangle whose vertical angle is  $14^\circ$  ?
13. How many degrees in each acute angle of a right-angled isosceles triangle ?
14. If one of the angles at the base of an isosceles triangle is double the angle at the vertex, how many degrees in each ?
15. If the angle at the vertex of an isosceles triangle is double one of the angles at the base, how many degrees in each ?
16. Two triangles mutually equilateral are mutually equiangular (48). Are two triangles mutually equiangular also mutually equilateral ?
17. Is a square a parallelogram ? Is a parallelogram a square ?
18. Is a rectangle a parallelogram ? Is a parallelogram a rectangle ?
19. How many sides equal to one another can there be in a trapezoid ? How many in a trapezium ?
20. How many degrees in each angle of an equiangular pentagon ? an equiangular hexagon ? octagon ? decagon ? dodecagon ?
21. If the parallel sides of a trapezoid are respectively 8 feet and 13 feet in length, how long is the line joining the middle points of the other two sides ?
22. If one of the angles of a parallelogram is  $120^\circ$ , how many degrees are there in each of the other angles ?

## EXERCISES.

The following Theorems, depending for their demonstration upon those already demonstrated, are introduced as exercises for the pupil. In some of them references are made to the propositions upon which the demonstration depends. They are not connected with the propositions in the following books, and can be omitted if thought best.

**68.** Two angles whose sides have, one pair the same, the other opposite directions, are supplements of each other. (12.) (8.)

**69.** Any side of a triangle is less than the sum, but greater than the difference, of the other two. (*Axiom 9.*)

**70.** The sum of the lines drawn from a point within a triangle to the extremities of one of the sides is less than the sum of the other two sides.

Produce one of the lines to the side of the triangle. (*Axiom 9.*)

**71.** The angle included by the lines drawn from a point within a triangle to the extremities of one of the sides is greater than the angle included by the other two sides.

Produce as in (70). (39.)

**72.** The angle at the base of an isosceles triangle being one fourth of the angle at the vertex, if a perpendicular is drawn to the base at its extreme point meeting the opposite side produced, the triangle formed by the perpendicular, the side produced, and the remaining side of the triangle, is equilateral.

**73.** If an isosceles and an equilateral triangle have the same base, and if the vertex of the inner triangle is equally distant from the vertex of the outer and the extremities of the base, then the angle at the base of the isosceles triangle is  $\frac{1}{4}$  or  $\frac{5}{2}$  of its vertical angle, according as it is the inner or the outer triangle.

**74.** Prove Theorem VII. by first drawing a line through *B* parallel to *A C*.

**75.** Prove Theorem VII. by drawing a triangle upon the floor, walking over its perimeter, and turning at each vertex through an angle equal to the angle at that vertex.

**76.** Only one perpendicular to a straight line can be drawn from a point.

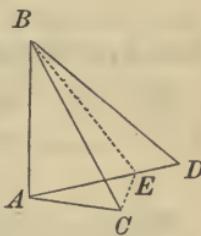

(Two cases. 1st. When the point is without the line. 2d. When the point is within the line.)

**77.** Two straight lines perpendicular to a third are parallel. (13.)

**78.** If a line joining two parallels is bisected, any other line drawn through the point of bisection and joining the parallels is bisected.

**79.** If two triangles have two sides of one respectively equal to two sides of the other, but the included angles unequal, the third side of the one having the included angle greater is greater than the third side of the other.

Place the triangles as in the figure; draw  $BE$  bisecting the angle  $CBD$ , and join  $C$  and  $E$ .

**80.** (Converse of 79.) If two triangles have two sides of one respectively equal to two sides of the other, but the third sides unequal, the included angle of the one having the third side greater is greater than the included angle of the other.

(Prove it by proving any other supposition absurd.)

**81.** Prove in Theorem XIII. the angles of the two triangles equal by reference to (80) then that the triangles are equal by (40) or (41).

**82.** (Converse of part of 62.) If the opposite sides of a quadrilateral are equal, the figure is a parallelogram.

**83.** (Converse of part of 62.) If the opposite angles of a quadrilateral are equal, the figure is a parallelogram.

**84.** (Converse of 63.) If a diagonal divides a quadrilateral into two equal triangles, is the figure necessarily a parallelogram?

**85.** The diagonals of a parallelogram bisect each other.

**86.** (Converse of 85.) If the diagonals of a quadrilateral bisect each other, the figure is a parallelogram.

**87.** The diagonals of a rhombus bisect each other at right angles.

**88.** (Converse of 87.) If the diagonals of a quadrilateral bisect each other at right angles, the figure is a rhombus or a square.

**89.** The diagonals of a rectangle are equal.

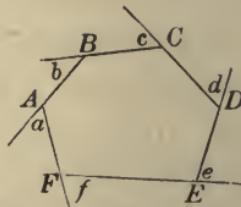

**90.** The diagonals of a rhombus bisect the angles of the rhombus.

**91.** Straight lines bisecting the adjacent angles of a parallelogram are perpendicular to each other.

**92.** From the vertices of a parallelogram measure equal distances upon the sides in order. The lines joining these points on the sides form a parallelogram.

**93.** Prove Theorem XX. by joining any point within to the vertices of the polygon.

**94.** If the sides of a polygon, as  $A B C D E F$ , are produced, the sum of the angles  $a, b, c, d, e, f$ , is equal to four right angles.

**95.** If a pavement is to be laid with blocks of the same regular form, that is, blocks whose faces are equiangular and equilateral, prove that their upper faces must be equilateral triangles, squares, or hexagons. (67 ; 9.)

**96.** If two kinds of regular figures, with sides of the same length, are to be used at each angular point, show that the pavement can be laid only with blocks whose upper faces are,

- 1st. Triangles and squares.
- 2d. Triangles and hexagons.
- 3d. Triangles and dodecagons.
- 4th. Squares and octagons.

How many of each must there be at each angular point ?

**97.** If three kinds of regular figures, with sides of the same length, are to be used at each angular point, show that the pavement can be laid only with blocks whose upper faces are,

- 1st. Triangles, squares, and hexagons.
- 2d. Squares, hexagons, and dodecagons.

How many of each must there be at each angular point ?

## RATIO AND PROPORTION.

### DEFINITIONS.

(It is necessary to understand the elementary principles of ratio and proportion before entering upon the Books that are to follow. It is therefore introduced here, but not numbered as one of the Books of Geometry, as it belongs properly to Algebra. Reference to the propositions in ratio and proportion will be made by the abbreviation Pn., with the number of the article annexed.)

**1. Ratio** is the relation of one quantity to another of the same kind ; or it is the quotient which arises from dividing one quantity by another of the same kind.

Ratio is indicated by writing the two quantities after one another with two dots between, or by expressing the division in the form of a fraction. Thus, the ratio of  $a$  to  $b$  is written,  $a : b$ , or  $\frac{a}{b}$ ; read,  $a$  is to  $b$ , or  $a$  divided by  $b$ .

**2. The Terms** of a ratio are the quantities compared, whether simple or compound.

The first term of a ratio is called the *antecedent*, the other the *consequent*; the two terms together are called a *couplet*.

**3. An Inverse or Reciprocal Ratio** of any two quantities is the ratio of their *reciprocals*. Thus, the *direct* ratio of  $a$  to  $b$  is  $a : b$ , that is,  $\frac{a}{b}$ ; the *inverse* ratio of  $a$  to  $b$  is  $\frac{1}{a} : \frac{1}{b}$ , that is,  $\frac{1}{a} \div \frac{1}{b} = \frac{b}{a}$ , or  $b : a$ .

**4. Proportion** is an equality of ratios. Four quantities are in proportion when the ratio of the first to the second is equal to the ratio of the third to the fourth.

The equality of two ratios is indicated by the sign of equality ( $=$ ), or by four dots ( $::$ ).

Thus,  $a : b = c : d$ , or  $a : b :: c : d$ , or  $\frac{a}{b} = \frac{c}{d}$ ; read  $a$  to  $b$  equals  $c$  to  $d$ , or  $a$  is to  $b$  as  $c$  is to  $d$ , or  $a$  divided by  $b$  equals  $c$  divided by  $d$ .

**5.** In a proportion the antecedents and consequents of the two ratios are respectively the *antecedents* and *consequents* of the proportion. The first and fourth terms are called the *extremes*, and the second and third the *means*.

**6.** When three quantities are in proportion, e. g.  $a : b = b : c$ , the second is called a *mean proportional* between the other two; and the third, a *third proportional* to the first and second.

**7.** A proportion is transformed by **Alternation** when antecedent is compared with antecedent, and consequent with consequent.

**8.** A proportion is transformed by **Inversion** when the antecedents are made consequents, and the consequents antecedents.

**9.** A proportion is transformed by **Composition** when in each couplet the sum of the antecedent and consequent is compared with the antecedent or with the consequent.

**10.** A proportion is transformed by **Division** when in each couplet the difference of the antecedent and consequent is compared with the antecedent or with the consequent.

**11.** *Axiom.* Two ratios respectively equal to a third are equal to each other.

## THEOREM I.

**12.** In a proportion the product of the extremes is equal to the product of the means.

Let

$$a : b = c : d$$

that is

$$\frac{a}{b} = \frac{c}{d}$$

Clearing of fractions

$$ad = bc$$

**13. Scholium.** A proportion is an equation; and making the product of the extremes equal to the product of the means is merely clearing the equation of fractions.

## THEOREM II.

**14.** If the product of two quantities is equal to the product of two others, the factors of either product may be made the extremes, and the factors of the other the means of a proportion.

Let

$$\underline{\underline{ad}} = \underline{\underline{bc}}$$

Dividing by  $bd$ 

$$\frac{a}{b} = \frac{c}{d}$$

that is

$$a : b = c : d$$

## THEOREM III.

**15.** If four quantities are in proportion, they will be in proportion by alternation.

Let

$$a : b = c : d$$

By (12)

$$ad = bc$$

By (14)

$$a : c = b : d$$

## THEOREM IV.

**16.** *If four quantities are in proportion, they will be in proportion by inversion.*

Let

$$a : b = c : d$$

By (12)

$$ad = bc$$

By (14) .

$$b : a = d : c$$

## THEOREM V.

**17.** *If four quantities are in proportion, they will be in proportion by composition.*

Let

$$a : b = c : d$$

that is

$$\frac{a}{b} = \frac{c}{d}$$

Adding 1 to each member

$$\frac{a}{b} + 1 = \frac{c}{d} + 1$$

or

$$\frac{a+b}{b} = \frac{c+d}{d}$$

that is

$$a+b : b = c+d : d$$

## THEOREM VI.

**18.** *If four quantities are in proportion, they will be in proportion by division.*

Let

$$a : b = c : d$$

that is

$$\frac{a}{b} = \frac{c}{d}$$

Subtracting 1 from each member

$$\frac{a}{b} - 1 = \frac{c}{d} - 1$$

or

$$\frac{a-b}{b} = \frac{c-d}{d}$$

that is

$$a-b : b = c-d : d$$

**19. Corollary.** From (17) and (18), by means of (15) and (11),

If

$$a : b = c : d$$

then

$$a + b : a - b = c + d : c - d$$

### THEOREM VII.

**20. Equimultiples of two quantities have the same ratio as the quantities themselves.**

For

$$\frac{a}{b} = \frac{m a}{m b}$$

that is

$$a : b = m a : m b$$

**21. Corollary.** It follows that either couplet of a proportion may be multiplied or divided by any quantity, and the resulting quantities will be in proportion. And since by (15), if  $a : b = m a : m b$ ,  $a : m a = b : m b$  or  $m a : a = m b : b$ , it follows that both consequents, or both antecedents, may be multiplied or divided by any quantity, and the resulting quantities will be in proportion.

### THEOREM VIII.

**22. If four quantities are in proportion, like powers or like roots of these quantities will be in proportion.**

Let

$$a : b = c : d$$

that is

$$\frac{a}{b} = \frac{c}{d}$$

Hence

$$\frac{a^n}{b^n} = \frac{c^n}{d^n}$$

that is

$$a^n : b^n = c^n : d^n$$

Since  $n$  may be either integral or fractional, the theorem is proved.

## THEOREM IX.

**23.** *If any number of quantities are proportional, any antecedent is to its consequent as the sum of all the antecedents is to the sum of all the consequents.*

Let

$$a : b = c : d = e : f$$

Now

$$a b = a b \quad (\text{A})$$

and by (12)

$$a d = b c \quad (\text{B})$$

and also

$$a f = b e \quad (\text{C})$$

Adding (A), (B), (C)       $\underline{a(b+d+f) = b(a+c+e)}$ Hence, by (14)       $a : b = a + c + e : b + d + f$ 

## THEOREM X.

**24.** *If there are two sets of quantities in proportion, their products, or quotients, term by term, will be in proportion.*

Let

$$a : b = c : d$$

and

$$e : f = g : h$$

By (12)

$$a d = b c \quad (\text{A})$$

and

$$e h = f g \quad (\text{B})$$

Multiplying (A) by (B)

$$\underline{a d e h = b c f g} \quad (\text{C})$$

Dividing (A) by (B)

$$\frac{a d}{e h} = \frac{b c}{f g} \quad (\text{D})$$

From (C) by (14)

$$a e : b f = c g : d h$$

and from (D)

$$\frac{a}{e} : \frac{b}{f} = \frac{c}{g} : \frac{d}{h}$$

## BOOK II.

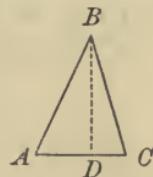

### RELATIONS OF POLYGONS.

#### DEFINITIONS.

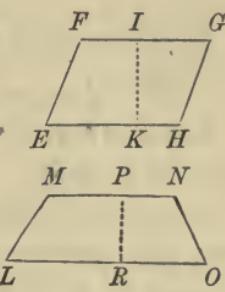

1. The **Area** of a polygon is the measure of its surface. It is expressed in units, which represent the number of times the polygon contains the square unit that is taken as a standard.

2. **Equivalent Polygons** are those which have the same area.

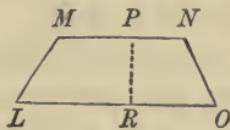

3. The **Altitude** of a triangle is the perpendicular distance from the opposite vertex to the base, or to the base produced ; as  $BD$ .

4. The **Altitude** of a parallelogram is the perpendicular distance from the opposite side to the base ; as  $IK$ .

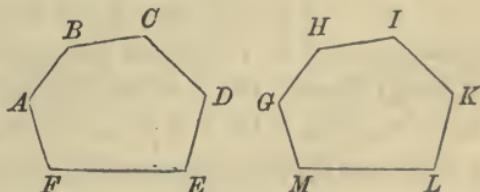

5. The **Altitude** of a trapezoid is the perpendicular distance between its parallel sides ; as  $PR$ .

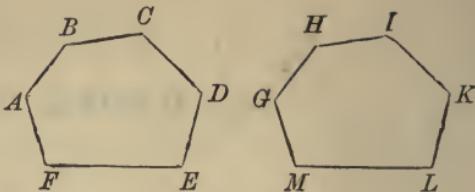

#### THEOREM I.

6. *Two polygons mutually equiangular and equilateral are equal.*

Let  $ABCDEF$  and  $GHIKLM$  be two polygons having the sides  $AB, BC, CD, DE, EF, FA$  and the angles  $A, B, C, D, E, F$ ,  $G, H, I, K, L, M$  respectively.

$C, D, E, F$  of the one respectively equal to the sides  $G H, H I, I K, K L, L M, M G$ , and the angles  $G, H, I, K, L, M$  of the other; then is the polygon  $A B C D E F$  equal to the polygon  $G H I K L M$ .

For if the polygon  $A B C D E F$  is applied to the polygon  $G H I K L M$  so that  $A B$  shall be on  $G H$  with the point  $A$  on  $G$ ,  $B$  will fall on  $H$ , as  $A B$  and  $G H$  are equal; and as the angle  $B$  is equal to the angle  $H$ ,  $B C$  will take the direction  $H I$ ; and as  $B C$  is equal to  $H I$ , the point  $C$  will fall on  $I$ ; and so also the points  $D, E, F$  will fall on the points  $K, L, M$ ; and the polygon  $A B C D E F$  will coincide with the polygon  $G H I K L M$ , and therefore be equal to it.

## THEOREM II.

**7.** *The area of a rectangle is equal to the product of its base and altitude.*

Let  $A B C D$  be a rectangle; its area  
 $= A D \times A B$ .

Suppose  $A B$  and  $A D$  to be divided into any number of equal parts,  $A E, E F, F H, H I, &c.$ , and through the points of division, lines  $E L, F M, H O, I P, &c.$  be drawn parallel to the sides of the rectangle; then the rectangle will be divided into squares; these squares will be equal to each other (6). If one of the equal parts,  $A E$ , represents the linear unit, then one of the squares,  $A E S H$ , represents the square unit; and there will be as many square units in the rectangle  $A E L D$  as there are linear units in  $A D$ ; and as many square units in the rectangle  $A B C D$  as there are square units in  $A E L D$  multiplied by the number representing the number of linear units in  $A B$ ; that

is, the area of the rectangle is equal to the product of its base and altitude, that is  $= AD \times AB$ .

**8. Scholium.** If  $AD$  and  $AB$  have no common measure, the linear unit may be taken as small as we please, that is, so small that the remainders will be infinitesimal, and can be neglected.

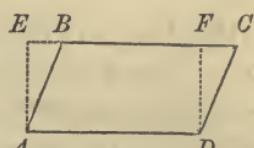

**9. Corollary.** The area of a square is the square of one of its sides.

### THEOREM III.

**10.** *The area of a parallelogram is equal to the product of its base and altitude.*

Let  $DF$  be the altitude of the parallelogram  $ABCD$ ; then the area of  $ABCD = AD \times DF$ .

At  $A$  draw the perpendicular  $AE$  meeting  $CB$  produced in  $E$ ;  $AEBD$  is a rectangle equivalent to the parallelogram  $ABCD$ . For the two triangles  $AEB$  and  $DFC$ , having the sides  $AE$ ,  $AB$  equal respectively to the sides  $DF$ ,  $DC$  (I. 64), and the included angle  $EAB$  equal to the included angle  $FDC$  (I. 12), are equal. Adding  $DFC$  to the common part  $ABFD$  gives the parallelogram  $ABCD$ ; and adding its equal  $AEB$  to the common part  $ABFD$ , gives the rectangle  $AEBD$ ; therefore the parallelogram  $ABCD$  is equivalent to the rectangle  $AEBD$ ; but the area of the rectangle  $= AD \times DF$  (7); therefore the area of the parallelogram  $= AD \times DF$ .

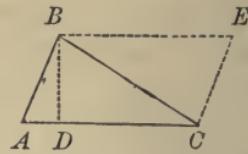

### THEOREM IV.

**11.** *The area of a triangle is equal to half the product of its base and altitude.*

Let  $BD$  be the altitude of the triangle  $ABC$ ; then the area of  $ABC = \frac{1}{2} AC \times BD$ .

Draw  $CE$  parallel to  $AB$ , and  $BE$  parallel to  $AC$ , forming the parallelogram  $ABEC$ . The triangle  $ABC$  is one half the parallelogram  $ABEC$  (I. 63); the area of the parallelogram  $= AC \times BD$  (10); therefore the area of the triangle  $= \frac{1}{2} AC \times BD$ .

**12. Cor. 1.** Triangles are to each other as the products of their bases and altitudes. For if  $A$  and  $a$  represent the altitudes of two triangles  $T$  and  $t$ , and  $B$  and  $b$  their bases, their areas are  $\frac{1}{2} A \times B$  and  $\frac{1}{2} a \times b$ ; therefore

$$T : t = \frac{1}{2} A \times B : \frac{1}{2} a \times b$$

or (Pn. 21)  $T : t = A \times B : a \times b$

**13. Cor. 2.** Triangles having equal bases are as their altitudes; those having equal altitudes as their bases. For in the proportion above, if  $B = b$ , or  $A = a$ , the equals can be cancelled from the second ratio (Pn. 21).

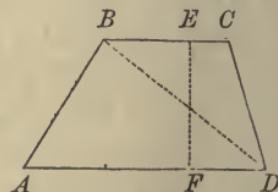

#### THEOREM V.

**14.** *The area of a trapezoid is equal to half the product of its altitude and the sum of its parallel sides.*

Let  $EF$  be the altitude of the trapezoid  $ABCD$ ; then the area of  $ABCD$   $= \frac{1}{2} EF \times (BC + AD)$ .

Draw the diagonal  $BD$ ; it will divide the trapezoid into two triangles,  $ABD$ ,  $BCD$ , having the same altitude  $EF$  as the trapezoid.

By (11) the area of  $BCD = \frac{1}{2} EF \times BC$   
and the area of  $ABD = \frac{1}{2} EF \times AD$   
Therefore the area of the trapezoid  $= \frac{1}{2} EF \times (BC + AD)$ .

**15. Corollary.** As (I. 66) the line joining the middle points of the sides  $AB$  and  $CD$  of the trapezoid  $= \frac{1}{2} (BC + AD)$ ,

therefore the area of a trapezoid is equal to the product of its altitude and the line joining the middle points of the sides which are not parallel.

## THEOREM VI.

**16.** *A line drawn parallel to one side of a triangle divides the other sides proportionally.*

In the triangle  $ABC$  let  $DE$  be drawn parallel to  $BC$ ; then

$$AE : EC = AD : DB$$

Draw  $DC$  and  $BE$ ; the triangles  $ADE$  and  $EDC$ , having the same vertex  $D$  and their bases in the same straight line  $AC$ , have the same altitude; therefore (13)

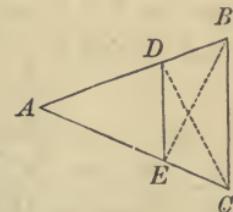

$$ADE : EDC = AE : EC$$

And the triangles  $ADE$  and  $DEB$ , having the same vertex  $E$  and their bases in the same straight line  $AB$ , have the same altitude; therefore (13)

$$ADE : DEB = AD : DB$$

But the triangles  $EDC$  and  $DEB$  are equivalent (11), since they have the same base  $DE$  and the same altitude, viz., the perpendicular distance between the two parallels  $DE$  and  $BC$ . Therefore (Pn. 11)  $AE : EC = AD : DB$

**17. Corollary.** As  $AE : EC = AD : DB$   
by (Pn. 17)  $AE + EC : AE = AD + DB : AD$   
that is,  $AC : AE = AB : AD$

## THEOREM VII.

## CONVERSE OF THEOREM VI.

**18. A line dividing two sides of a triangle proportionally is parallel to the third side of the triangle.**

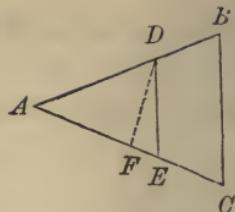

In the triangle  $ABC$  if  $DE$  divides  $AB$  and  $AC$  so that  $AB : AD = AC : AE$ , then  $DE$  is parallel to  $BC$ .

For if  $DE$  is not parallel to  $BC$ , through  $D$  draw  $DF$  parallel to  $BC$ ; then (17)

$$AB : AD = AC : AF$$

But by hypothesis

$$AB : AD = AC : AE$$

Now as the first three terms of these two proportions are the same, their fourth terms must be equal: that is,  $AF = AE$ , the part equal to the whole, which is absurd (*Axiom 6*); therefore  $DE$  is parallel to  $BC$ .

**19. Definition.** **Similar Polygons** are those which are mutually equiangular, and have their homologous sides, that is, the sides including the corresponding angles, proportional.

### THEOREM VIII.

**20. Two triangles mutually equiangular are similar.**

In the two triangles  $ABC$ ,  $DEF$ , let the angle  $A = D$ ,  $B = E$ , and  $C = F$ ; then the triangles are similar.

As the triangles are mutually equiangular, we have only to prove the homologous sides proportional. Cut off  $AG$  and  $AH$  equal respectively to  $DE$  and  $DF$ , and join  $GH$ ; the triangle  $AGH$  is equal to  $DEF$  (I. 40), and the angle  $AGH = E$ ; but  $E = B$ ; therefore  $AGH = B$ , and  $GH$  is parallel to  $BC$  (I. 18); and (17)

$$AB : AG = AC : AH$$

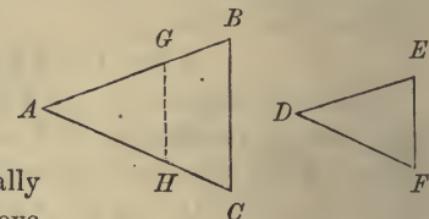

or

$$AB : DE = AC : DF$$

In like manner it may be proved that

$$AB : DE = BC : EF = AC : DF$$

**21. Cor.** Two triangles whose homologous sides are equally inclined to each other are similar. For if one of the triangles is

turned through an angle equal to the angle of inclination of the sides, the sides of the triangles become respectively parallel; they are therefore mutually equiangular (I. 12) and similar (20).

## THEOREM IX.

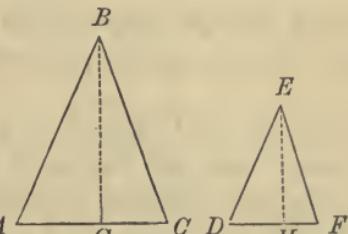

**22.** *The altitudes of two similar triangles are proportional to the homologous sides.*

Let  $BG$  and  $EH$  be the altitudes of the similar triangles  $ABC$  and  $DEF$ ; then

$$BG : EH = AB : DE = \\ AC : DF = BC : EF$$

For the two right triangles  $ABG$ ,  $DEH$  are mutually equiangular (I. 35), and similar (20); therefore

$$BG : EH = AB : DE = AC : DF = BC : EF$$

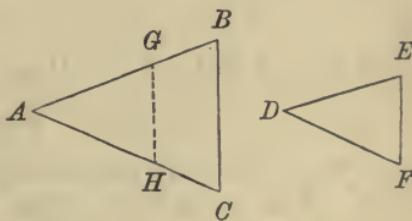

## THEOREM X.

**23.** *Two triangles having an angle of the one equal to an angle of the other, and the sides including these angles proportional, are similar.*

In the triangles  $ABC$ ,  $DEF$   
let the angle  $A = D$  and

$$AB : DE = AC : DF$$

then the triangles  $ABC$  and  $DEF$  are similar.

Cut off  $AG$  and  $AH$  respectively equal to  $DE$  and  $DF$ , and join  $GH$ ; the triangle  $AGH = DEF$ , and the angle  $AGH = E$  (I. 40).

By hypothesis  $AB : DE = AC : DF$

or  $AB : AG = AC : AH$

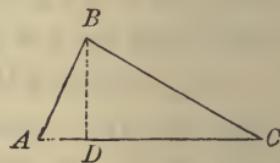

that is, the sides  $AB$ ,  $AC$  are divided proportionally by the

line  $G H$ ; therefore  $G H$  is parallel to  $B C$  (18), and the angle  $A G H = B$  (I. 17); but the angle  $A G H = E$ ; therefore  $B = E$ , and the two triangles are mutually equiangular and therefore similar (20).

## THEOREM XI.

**24.** *In a right triangle the perpendicular drawn from the vertex of the right angle to the hypothenuse divides the triangle into two triangles similar to the whole triangle and to each other.*

In the right triangle  $A B C$  if  $B D$  is drawn from the vertex  $B$  of the right angle perpendicular to the hypothenuse  $A C$ , the two triangles  $A B D, B C D$  are similar to  $A B C$  and to each other.

The two right triangles  $A B D$  and  $A B C$  have the acute angle  $A$  common; they are therefore mutually equiangular (I. 35), and similar (20). The two right triangles  $A B C$  and  $B C D$  have the acute angle  $C$  common; therefore they are mutually equiangular and similar. The two triangles  $A B D$  and  $B C D$ , being each similar to  $A B C$ , are similar to each other.

**25. Cor. 1.** Since  $A B C$  and  $A B D$  are similar triangles

$$A C : A B = A B : A D$$

And since  $A B C$  and  $B C D$  are similar

$$A C : C B = C B : C D$$

that is, *if in a right triangle a perpendicular is drawn from the vertex of the right angle to the hypothenuse, either side about the right angle is a mean proportional between the whole hypothenuse and the adjacent segment.*

**26. Cor. 2.** As  $A B D$  and  $B C D$  are similar triangles

$$A D : D B = D B : D C$$

that is, in a right triangle the perpendicular from the vertex of the right angle to the hypothenuse is a mean proportional between the segments of the hypothenuse.

## THEOREM XII.

**27.** The square described on the hypothenuse of a right triangle is equivalent to the sum of the squares described upon the other two sides.

Let  $A B C$  be a triangle right-angled at  $B$ ; then

$$\overline{A C}^2 = \overline{A B}^2 + \overline{B C}^2$$

On the three sides construct squares, draw  $B D$  perpendicular to  $A C$ , and produce it to  $F E$ ;  $D C E L$  is a rectangle whose area is (7)

$$C E \times C D = A C \times C D$$

The area of the square (9)

$$BIKC = \overline{BC}^2$$

But (25)  $A C : B C = B C : C D$

or  $A C \times C D = \overline{BC}^2$

that is, the square  $BIKC$  is equivalent to the rectangle  $DCEL$ . In the same way the square  $AGHB$  can be proved equivalent to the rectangle  $ADLF$ ; therefore the sum of the two rectangles, that is, the square  $ACEF$  is equivalent to the sum of the squares  $BIKC$  and  $AGHB$ ; or

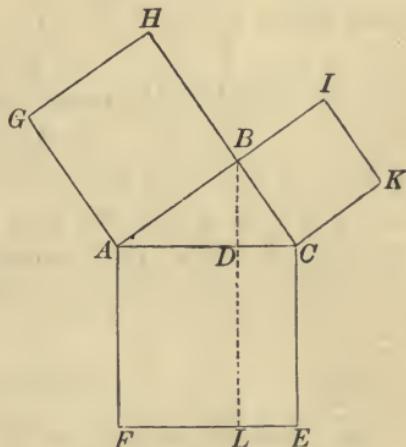

$$\overline{AC}^2 = \overline{AB}^2 + \overline{BC}^2$$

**28. Corollary.** Since

$$\overline{AC}^2 = \overline{AB}^2 + \overline{BC}^2$$

$$\overline{BC}^2 = \overline{AC}^2 - \overline{AB}^2$$

$$BC = \sqrt{\overline{AC}^2 - \overline{AB}^2}$$

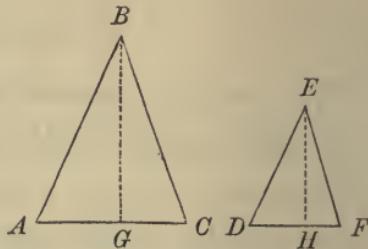

## THEOREM XIII.

**29.** Similar triangles are to each other as the squares of their homologous sides.

Let  $A B C$  and  $D E F$  be two similar triangles; then

$$A B C : D E F = \overline{A C}^2 : \overline{D F}^2$$

Draw  $B G$  and  $E H$  perpendicular respectively to  $A C$  and  $D F$ ; then (22)

$$B G : E H = A C : D F$$

this multiplied by the proportion

$$\frac{1}{2} A C : \frac{1}{2} D F = A C : D F$$

gives  $\frac{1}{2} A C \times B G : \frac{1}{2} D F \times E H = \overline{A C}^2 : \overline{D F}^2$

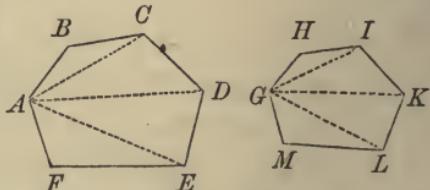

but  $\frac{1}{2} A C \times B G$  is the area of  $A B C$ , and  $\frac{1}{2} D F \times E H$  is the area of  $D E F$  (11); therefore

$$A B C : D E F = \overline{A C}^2 : \overline{D F}^2$$

## THEOREM XIV.

**30.** Similar polygons can be divided into the same number of similar triangles.

Let  $A B C D E F$  and  $G H I K L M$  be similar polygons; they can be divided into the same number of similar triangles.

From the homologous vertices  $A$  and  $G$  draw the diagonals  $A C, A D, A E, G I, G K$ , and  $G L$ ; these diagonals divide the polygons as required. For, as the polygons are similar, the angle  $B = H$ , and  $A B : G H = B C : H I$ ; therefore the triangles  $A B C$  and  $G H I$  are similar (23). As the triangles  $A B C$  and  $G H I$  are similar, the angle  $B C A = H I G$ ; but the whole angle  $B C D = H I K$ ; therefore the angle  $A C D = G I K$ ; and as the triangles  $A B C$  and  $G H I$  are similar

$$BC : HI = AC : GI$$

$$\text{But } BC : HI = CD : IK$$

$$\text{Therefore } AC : GI = CD : IK$$

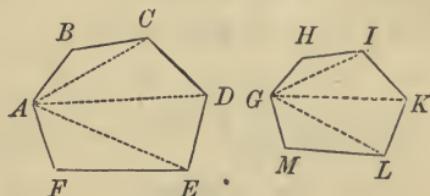

and  $ACD$  and  $GIK$  are similar (23). In like manner it can be proved that the other triangles are similar each to each.

## THEOREM XV.

**31.** *The perimeters of similar polygons are to each other as the homologous sides; and the polygons as the squares of the homologous sides.*

Let  $A B C D E F$  and  $G H I K L M$  be two similar polygons.

1st. Their perimeters are to each other as  $AB : GH$

For as the polygons are similar

$$AB : GH = BC : HI = CD : IK, \text{ &c.}$$

Therefore (Pn. 23)

$AB + BC + CD, \text{ &c.} : GH + HI + IK, \text{ &c.} = AB : GH$   
that is, the perimeters of  $A B C D E F$  and  $G H I K L M$  are as  $AB : GH$ .

$$2d. \quad A B C D E F : G H I K L M = \overline{AB^2} : \overline{GH^2}$$

From the homologous vertices  $A$  and  $G$  draw the diagonals  $AC, AD, AE, GI, GK$ , and  $GL$ ; the polygons will be divided into the same number of similar triangles (30); therefore (29)

$$ABC : GHI = \overline{AC^2} : \overline{GI^2}$$

$$\text{and } ACD : GIK = \overline{AC^2} : \overline{GI^2}$$

$$\text{Therefore } ABC : GHI = ACD : GIK$$

$$\text{In like manner } ACD : GIK = ADE : GKL$$

$$\text{and } ADE : GKL = AEF : GLM$$

Hence (Pn. 23)

$$ABC + ACD + ADE + AEF : GHI + GIK + GKL + GLM = ABC : GHI$$

$$\text{But } ABC : GHI = \overline{AB^2} : \overline{GH^2}$$

Therefore the sums of the triangles, that is, the polygons themselves, are to each other as the squares of the homologous sides.

**32. Definition.** A **Regular Polygon** is one that is both equiangular and equilateral.

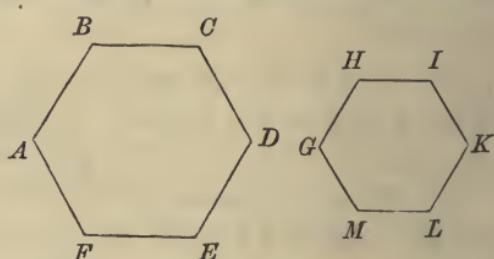

### THEOREM XVI.

**33. Regular polygons of the same number of sides are similar.**

Let  $A B C D E F$  and  $G H I K L M$  be two regular polygons of the same number of sides ; they are similar.

They are *mutually* equiangular ; for the sum of their angles is the same (I. 67) ; and each angle is equal to this sum divided by the number of angles which is the same.

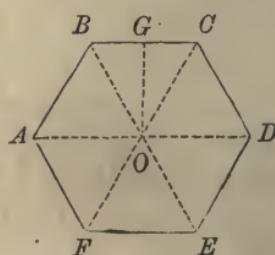

The homologous sides are proportional ; for as the polygons are regular,  $A B = B C = C D$ , &c., and  $G H = H I = I K$ , &c., therefore  $A B : G H = B C : H I = C D : I K$ , &c.

### THEOREM XVII.

**34. There is a point in a regular polygon equidistant from its vertices, and also equidistant from its sides.**

Let  $A B C D E F$  be a regular polygon. Bisect the angles  $A$  and  $B$  by  $A O$  and  $B O$ . As the whole angles  $A$  and  $B$  are each less than two right angles, the sum of  $O A B$  and  $A B O$  is less than two right angles ; therefore  $A O$  and  $B O$  cannot be parallel (I. 17), but will meet.

Suppose them to meet in the point  $O$ ; then  $O$  is equidistant from the vertices  $A, B, C, D, E, F$ , and also from the sides  $AB, BC, CD, \&c.$

Draw  $OC, OD, OE, OF$ .  $OA = OB$  (I. 45). As  $OB$  bisects the whole angle  $B$ , the angle  $OB A = OBC$ ; therefore the triangle  $ABO = OBC$  (I. 40), and  $OC = OA = OB$ . In like manner it can be proved that  $OD = OE = OF = OA$ ; that is,  $O$  is equidistant from the vertices of the polygon.

As the triangles  $OAB, OBC, OCD, \&c.$  are equal, their altitudes are equal, that is, the bases are equidistant from the vertex  $O$ .

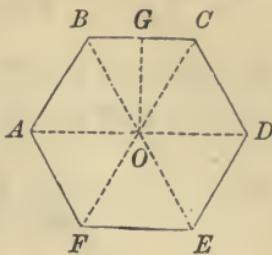

**35. Scholium.**  $O$  is called *the centre*, and the perpendicular  $OG$  *the apothem of the polygon*.

**36. Corollary.** In regular polygons of the same number of sides, the apothems are as the homologous sides; therefore *the perimeters of regular polygons of the same number of sides are as their apothems; and the polygons as the squares of their apothems.*

### THEOREM XVIII.

**37. The area of a regular polygon is equal to half the product of its perimeter and apothem.**

For, if a regular polygon is divided into triangles by lines drawn from the centre to the several vertices, the area of each triangle is equal to half the product of its base and the apothem of the polygon (11); therefore the area of the polygon is equal to half the product of the sum of the bases, that is, to half the product of its perimeter and its apothem.

## PRACTICAL QUESTIONS.

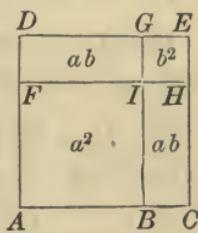

1. What is the perimeter and the area of a rectangle 25 by 35 inches ?
2. What is the area of a parallelogram whose base is 20 feet and altitude 12 feet ?
3. What is the area of a triangle whose base is 14 feet and altitude 8 feet ?
4. What is the square surface of a board 15 feet long, and 16 inches wide at one end and 9 inches at the other ? What kind of a figure is it ?
5. What integral numbers will express the sides and hypotenuse of a right triangle ?
6. How far from a tower 40 feet high must the foot of a ladder 50 feet long be placed that it may exactly reach the top of the tower ?
7. The foot of a ladder 67 feet long stands 40 feet from a wall ; how much nearer the wall must the foot be placed that the ladder may reach 10 feet higher ?
8. If a ladder 108 feet long, with its foot in the street, will reach on one side to a window 75 feet high, and on the other to a window 45 feet high, how wide is the street ?
9. A has an acre of land one of whose sides is 20 rods in length ; B has a piece of land of exactly similar form containing 9 acres. What is the length of the corresponding side of B's ?
10. What is the distance on the floor from one corner to the opposite corner of a rectangular room 16 by 24 feet ?
11. If the height of the above room is 10 feet, what is the distance from the lower corner to the opposite upper corner ?
12. Find the length of the longest straight rod that can be put into a box whose inner dimensions are 12, 4, and 3.
13. What is the altitude of an equilateral triangle whose side is 12 feet ?
14. If the bases of two similar triangles are respectively 100 and 10 feet, how many triangles equal to the second are equivalent to the first ?
15. How many times as much paint will it take to cover a church whose steeple is 120 feet in height as to cover an exact model of the church whose steeple is 10 feet in height ?
16. What is the area of a right-angled triangle whose hypotenuse is 125 feet and one of the sides 75 feet ?

## EXERCISES.

The following Theorems, depending for their demonstration upon those already demonstrated, are introduced as exercises for the pupil. In some of them references are made to the propositions upon which the demonstration depends. They are not connected with the propositions in the following books, and can be omitted if thought best.

- 38.** The square on the sum  $A C$  of two straight lines  $A B, B C$  is equivalent to the squares on  $A B$  and  $B C$ , together with twice the rectangle  $A B, B C$ .

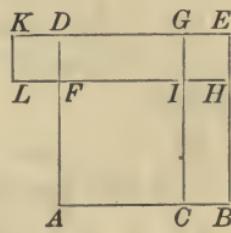

Or, algebraically, if  $a = A B$ , and  $b = B C$ ,

$$(a + b)^2 = a^2 + 2 ab + b^2$$

- 39.** *Corollary.* The square on a line is four times the square on half of the line.

- 40.** The square on the difference  $A C$  of two straight lines  $A B, B C$  is equivalent to the squares on  $A B$  and  $B C$ , diminished by twice the rectangle  $A B, B C$ .

Or, algebraically, if  $a = A B$ , and  $b = B C$ ,

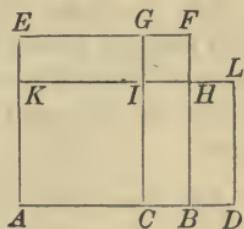

$$(a - b)^2 = a^2 - 2 ab + b^2$$

- 41.** The rectangle contained by the sum and difference of two lines  $A B, B C$  is equivalent to the difference of their squares.

Or, algebraically, if  $a = A B$  and  $b = B C$

$$(a + b)(a - b) = a^2 - b^2$$

Produce  $A B$  so that  $BD = BC$ .

- 42.** Parallelograms are to each other as the products of their bases and altitudes. (10.)

- 43.** Parallelograms having equal bases are to each other as their altitudes; those having equal altitudes are as their bases.

- 44.** Where must a line from the vertex be drawn to bisect a triangle? (13.)

- 45.** Two or more lines parallel to the base of a triangle divide the other sides, or the other sides produced, proportionally.

**46.** Lines joining the middle points of the adjacent sides of a quadrilateral form a parallelogram; and the perimeter of this parallelogram is equal to the sum of the diagonals of the quadrilateral.

Draw the diagonals. (18.)

**47.** Lines drawn from the vertex of a triangle divide the opposite side and a parallel to it proportionally.

**48.** State and prove the converse of 47.

**49.**  $A B C D$  is a parallelogram;  $E$  and  $F$  the middle points of  $A B$  and  $C D$ .  $B F$  and  $D E$  trisect the diagonal  $A C$ .

**50.** If two triangles have two sides of the one equal respectively to two sides of the other, and the included angles supplementary, the triangles are equivalent.

**51.** The diagonals divide a parallelogram into four equivalent triangles. Two triangles standing on opposite sides are equal.

**52.** If the middle points of the sides of a triangle are joined, the area of the triangle thus formed is one fourth the area of the original triangle.

**53.** Every line passing through the intersection of the diagonals of a parallelogram bisects the parallelogram.

**54.** If a point within a parallelogram is joined to the vertices, the two triangles formed by the joining lines and two opposite sides are together equivalent to half the parallelogram.

Through the point draw lines parallel to the sides of the parallelogram.

**55.** State and prove the proposition if the point named in 54 is without the parallelogram.

**56.** The area of a trapezoid is equal to twice the area of the triangle formed by joining the extremities of one non-parallel side to the middle point of the other.

**57.** Two triangles are similar if two angles of the one are equal respectively to two angles of the other.

**58.** Two triangles are similar if their homologous sides are proportional.

**59.** *Definition.* When a point is taken on a given line, or a given line produced, the distances of the point from the extremities of the line are called the *segments*. If the point is within the given line, the sum of the segments, if in the line produced, the difference of the segments, is equal to the line.

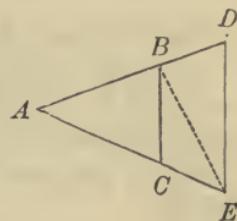

**60.** The line bisecting any angle, interior or exterior, of a triangle, divides the opposite side into segments which are proportional to the adjacent sides.

Let  $B$  be the bisected angle of a triangle  $ABC$ . Through  $C$  draw a line parallel to the bisecting line and meeting  $AB$ . If the interior angle at  $B$  is bisected,  $AB$  must be produced; if the exterior angle,  $AC$ . In the latter case, if  $E$  is the point where the bisecting line meets  $AC$  produced, the segments of the base (59) are  $AE$  and  $CE$ . (I. 17.) (I. 45.) (16.)

**61.** Two triangles having an angle of the one equal to an angle in the other are to each other as the rectangles of the sides containing the equal angles; or

$$ABC : ADE = AB \times AC : AD \times AE$$

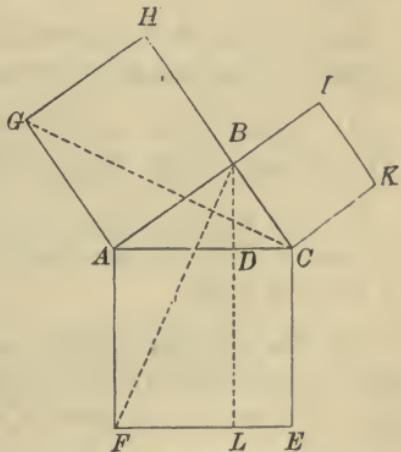

Draw  $BE$ . (13.) (Pn. 24.) (Pn. 21.)

**62.** Prove Theorem XII., first drawing  $GC$  and  $BF$ ; then proving the triangles  $AGC$  and  $ABF$  equal.

Turn the triangle  $ABF$  on the point  $A$  in its own plane till  $AB$  coincides with  $AG$ ; where will  $F$  be? (7, 11.)

**63.** Prove that if  $GH$ ,  $KI$ , and  $LB$ , in the figure above, are produced, they will meet in the same point.

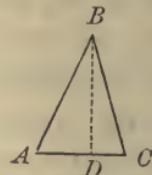

**64.** Prove Theorem XII., first producing  $FA$  to  $GH$ , and producing  $GH$ ,  $KI$ , and  $LB$  till they meet.

**65.** Prove Theorem XII., first constructing the squares on opposite sides of  $AB$  and  $BC$  from that on which they are drawn in the figure in Art. 62; moving the square  $AGHB$  on  $AB$ , a distance

equal to  $BC$  in the direction  $BA$ ; then proving that these squares are divided into parts that can be made to coincide with the parts of the square on  $AC$ .

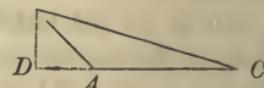

**66.** If  $A$  is an acute angle of the triangle  $ABC$ , and  $BD$  is the perpendicular from  $B$  to  $AC$ , then

$$BC^2 = AB^2 + AC^2 - 2 AC \times AD$$

**67.** If  $A$  is an obtuse angle of the triangle  $ABC$ , and  $BD$  is the perpendicular from  $B$  to  $AC$ , then

$$BC^2 = AB^2 + AC^2 + 2 AC \times AD$$

**68.** Show that if the angle  $A$  becomes a right angle, both 66 and 67 reduce to the same as 27; and if  $C$  becomes a right angle, both reduce to the same as the second equation in 28.

**69.** If a line is drawn from the vertex of any angle of a triangle to the middle of the opposite side, the sum of the squares of the other two sides is equivalent to twice the square of the bisecting line together with twice the square of a segment of the bisected side.

Draw a perpendicular from the same vertex to the opposite side.  
(66, 67.)

**70.** The sum of the squares of the four sides of a parallelogram is equivalent to the sum of the squares of the diagonals. (69.) (39.)

**71.** In the figure in Art. 62 draw  $HI$ ,  $KE$ ,  $FG$ . The triangle  $HIB$  is equal, and the triangles  $CKE$ ,  $GAF$  are equivalent to  $ABC$ .

**72.** The squares of the sides of a right triangle are as the segments of the hypotenuse made by a perpendicular from the vertex of the right angle.

**73.** The square of the hypotenuse is to the square of either side as the hypotenuse is to the segment adjacent to this side made by a perpendicular from the vertex of the right angle.

**74.** The side of a square is to its diagonal as  $1:\sqrt{2}$ ; or the square described on the diagonal of a square is double the square itself.

**75.** (Converse of 30.) Two polygons composed of the same number of similar triangles similarly situated are similar.

## BOOK III.

### THE CIRCLE.

#### DEFINITIONS.

**1.** A **Circle** is a plane figure bounded by a curved line called the *circumference*, every point of which is equally distant from a point within called the *centre*; as *A B D E*.

**2.** The **Radius** of a circle is a line drawn from the centre to the circumference; as *C D*.

**3.** The **Diameter** of a circle is a line drawn through the centre and terminating at both ends in the circumference; as *A D*.

**4.** *Corollary.* The radii of a circle, or of equal circles, are equal; also the diameters are equal, and each is equal to double the radius.

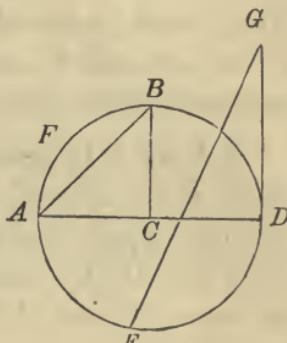

**5.** An **Arc** is any part of the circumference; as *A F B*.

**6.** A **Chord** is the straight line joining the ends of an arc; as *A B*.

**7.** A **Segment** of a circle is the part of the circle cut off by a chord; as the space included by the arc *A F B* and the chord *A B*.

**8.** A **Sector** is the part of a circle included by two radii and the intercepted arc; as the space *B C D*.

**9.** A **Tangent** (in geometry) is a line which touches, but does not, though produced, cut the circumference; as *G D*.

A tangent is often considered as terminating at one end at the point of contact, at the other where it meets another tangent or a secant.

**10.** A Secant (in geometry) is a line lying partly within and partly without a circle; as  $GE$ .

A secant is generally considered as terminating at one end where it meets the concave circumference, and at the other where it meets another secant or a tangent.

### THEOREM I.

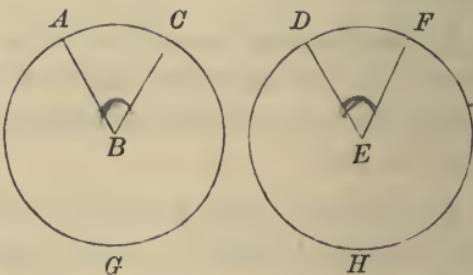

**11.** In the same circle, or equal circles, equal angles at the centre are subtended by equal arcs; and, conversely, equal arcs subtend equal angles at the centre.

Let  $B$  and  $E$  be equal angles at the centres of the two equal circles  $ACG$  and  $DFH$ ; then the arcs  $AC$  and  $DF$  are equal.

Place the angle  $B$  on the angle  $E$ ; as they are equal they will coincide; and as  $BA$  and  $BC$  are equal to  $ED$  and  $EF$ , the point  $A$  will coincide with  $D$ , and the point  $C$  with  $F$ ; and the arc  $AC$  will coincide with  $DF$ , otherwise there would be points in the one or the other arc unequally distant from the centre.

*Conversely.* If the arcs  $AC$  and  $DF$  are equal, the angles  $B$  and  $E$  are equal.

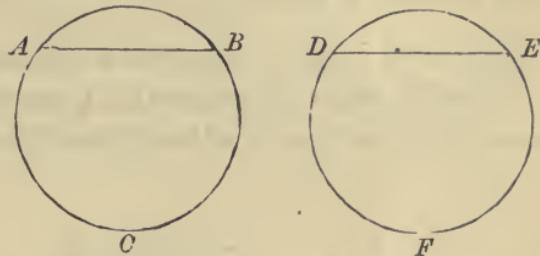

For, if the radius  $AB$  is placed on the radius  $DE$  with the point  $B$  on  $E$ , the point  $A$  will fall on  $D$ , as  $AB = DE$ ; and the arc  $AC$  will coincide with  $DF$ , otherwise there would be points in the one or the other arc unequally distant from the centre; and as the arc  $AC = DF$ , the point  $C$  will fall on  $F$ ; therefore  $BC$  will coincide with  $EF$ , and the angle  $B$  be equal to  $E$ .

## THEOREM II.

**12.** In the same or equal circles, equal chords subtend equal arcs ; and, conversely, equal arcs are subtended by equal chords.

Let  $A B C$  and  $D E F$  be two equal circles ; if the arcs  $A B$  and  $D E$  are equal, the chords  $A B$  and  $D E$  are

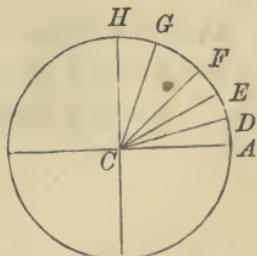

equal ; and conversely, if the chords  $A B$  and  $D E$  are equal, the arcs  $A B$  and  $D E$  are equal.

For, if the centre of the circle  $A B C$  is placed on the centre of  $D E F$  with the point  $A$  of the circumference on the point  $D$ , if the arcs or the chords are equal,  $B$  will fall on  $E$  ; and in either case the chords and arcs will coincide, otherwise there would be points in the one or the other circumference unequally distant from the centre.

## THEOREM III.

**13.** Angles at the centre vary as their corresponding arcs.

Let  $ACD$ ,  $DCE$ ,  $ECF$  be equal angles at the centre  $C$  ; then the arcs  $AD$ ,  $DE$ ,  $EF$  are equal (11) ; then the angle  $ACE$  is double the angle  $ACD$ , and the arc  $AE$  double the arc  $AD$  ; and the angle  $ACF$  is three times the angle  $ACD$ , and the arc  $AF$  three times the arc  $AD$  ; and if the angle  $ACG$  is  $m$  times the angle  $ACD$ , the arc  $AG$  is  $m$  times the arc  $AD$  ; that is, the angle varies as the arc, or the arc as the angle.

**14.** *Cor. 1.* As angles at the centre vary as their arcs, or arcs as their corresponding angles, either of these quantities may be assumed as the measure of the other. The measure of an angle is, then, *the arc included between its sides and described from its vertex as a centre*.

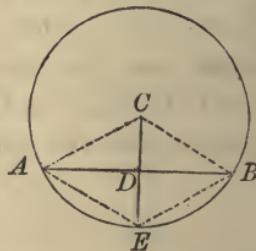

**15.** *Cor. 2.* As the sum of all the angles about the point  $C$  is equal to four right angles (I. 9), one right angle,  $HCA$ , is measured by one quarter of the circumference, or by a quadrant.

#### THEOREM IV.

**16.** *The radius perpendicular to a chord bisects the chord and the arc subtended by the chord.*

Let  $CE$  be a radius perpendicular to the chord  $AB$ ; it bisects the chord  $AB$ , and also the arc  $AEB$ .

Draw the radii  $CA$  and  $CB$  and the chords  $AE$  and  $EB$ . As equal oblique lines are equally distant from the perpendicular,  $AD = DB$  (I. 52); and as  $E$  is a point in the perpendicular to the middle of  $AB$ , it is equally distant from  $A$  and  $B$  (I. 53); therefore the chords and hence (12) the arcs  $AE$ ,  $EB$  are equal.

**17.** *Corollary.* The perpendicular to the middle of a chord passes through the centre of the circle, and of the arc; and the radius drawn to the centre of an arc bisects its chord perpendicularly.

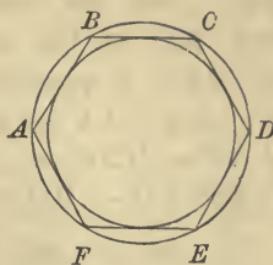

#### DEFINITIONS.

**18.** An **Inscribed Angle** is one whose vertex is in the circumference and whose sides are chords; as  $ABC$  in the outer circle

**19.** An **Inscribed Polygon** is one whose sides are chords.

Thus  $ABCDEF$  is inscribed in the outer circle. In this case the circle is said to be circumscribed about the polygon.

**20.** A Circumscribed Polygon is one whose sides are tangents. Thus  $ABCDEF$  is circumscribed about the inner circle. In this case the circle is said to be inscribed in the polygon.

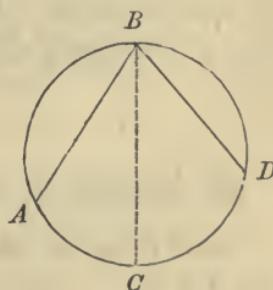

## THEOREM V.

**21.** An inscribed angle is measured by half the arc included by its sides.

1st. When one of the sides  $BD$  is a diameter; then the angle  $B$  is measured by half the arc  $AD$ . Draw the radius  $CA$ , and the triangle  $ACB$  is isosceles,  $CA$  and  $CB$  being radii; therefore the angle  $A = B$  (I. 42). But the exterior angle  $ACD$  is equal to the sum of the two angles  $A$  and  $B$  (I. 39); therefore the angle  $B$  is equal to half the angle  $ACD$ ; the angle  $ACD$  is measured by the arc  $AD$  (14); therefore the angle  $B$  is measured by half the arc  $AD$ .

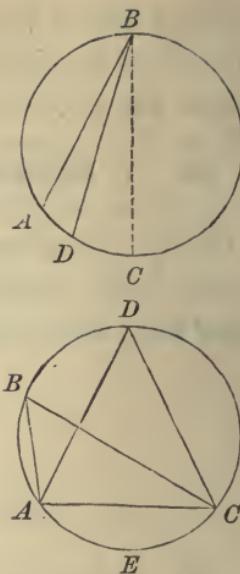

2d. When the centre is within the angle, draw the diameter  $BC$ . By the preceding part of the proposition the angle  $ABC$  is measured by half the arc  $AC$ , and  $CBD$  by half  $CD$ ; therefore  $ABC + CBD$ , or  $ABD$ , is measured by half  $AC + CD$ , or half the arc  $AD$ .

3d. When the centre is without the angle, draw the diameter  $BC$ . By the first part of the proposition the angle  $ABC$  is measured by half the arc  $AC$ , and  $DBC$  by half  $DC$ ; therefore  $ABC - DBC$ , or  $ABD$ , is measured by half  $AC - DC$ , or half the arc  $AD$ .

**22.** *Cor.* 1. All the angles  $ABC$ ,  $ADC$ , inscribed in the same segment are equal; for each is measured by half the arc  $AEC$ .

**23.** *Cor.* 2. Every angle inscribed in a semicircle is a right angle; for it is measured by half a semi-circumference, or by a quadrant (15).

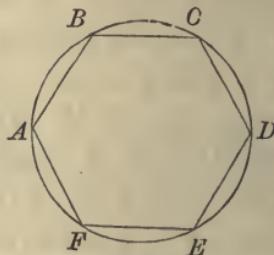

#### THEOREM VI.

**24.** *Every equilateral polygon inscribed in a circle is regular.*

Let  $ABCDEF$  be an equilateral polygon inscribed in a circle; it is also equiangular and therefore regular.

For the chords  $AB$ ,  $BC$ ,  $CD$ , &c. being equal, the arcs  $AB$ ,  $BC$ ,  $CD$ , &c. are equal (12); therefore the arc  $AB +$  the arc  $BC$  will be equal to the arc  $BC +$  the arc  $CD$ , &c.; that is, the angles  $B$ ,  $C$ , &c. are in equal segments; therefore they are equal (22), and the polygon is equiangular and regular.

#### THEOREM VII.

**25.** *An infinitely small chord coincides with its arc.*

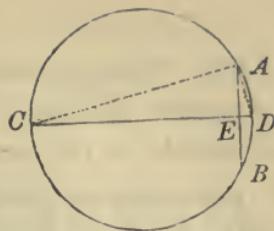

Let  $AB$  be an infinitely small chord; it coincides with the arc  $ADB$ .

Draw the diameter  $CD$  perpendicular to the chord  $AB$ ; and draw  $AC$  and  $AD$ ;  $CAD$  is a right-angled triangle (23); therefore (II. 26)

$$CE : AE = AE : ED$$

that is,  $ED$  is the same part of  $AE$  that

$AE$  is of  $CE$ . But  $AE$  is half the infinitely small chord  $AB$  (16), and  $AB$  is infinitely small in comparison with  $CE$ ; therefore  $ED$  is infinitely small in comparison with  $AE$ , that is, the point  $E$  is on  $D$ , and the chord  $AB$  coincides with the arc  $ADB$ .

### THEOREM VIII.

**26.** *A circle is a regular polygon of an infinite number of sides.*

If the circumference of a circle is divided into equal arcs, each infinitely small, the infinitely small chords of these arcs would form a regular polygon (24) of an infinite number of sides; and as each chord would coincide with its arc (25), the polygon would be the circle itself.

**27. Scholium.** It might be supposed that although the difference between each chord and its arc is infinitesimal, yet as there is an infinite number of these differences their sum would not be infinitesimal and ought not to be neglected; that is, that the perimeter of the polygon and the circumference of the circle differed by a finite quantity. But each chord is infinitely small compared with the diameter of the circle, or is equal to  $\frac{D}{Inf.}$ ; and the difference between each chord and its arc is infinitely smaller than the chord itself, or is equal to  $\frac{D}{Inf. \times Inf.}$ ; and an infinite number of these differences is equal to  $\frac{D}{Inf. \times Inf.} \times Inf. = \frac{D}{Inf.}$ ; that is, the difference between the perimeter of the polygon and the circumference of the circle is infinitesimal.

## THEOREM IX.

**28.** *Circumferences of circles are to each other as their radii, or as their diameters; and the circles themselves as the squares of their radii, or the squares of their diameters.*

For circles are regular polygons of an infinite number of sides (26); and if the circumferences of circles are divided into the same infinite number of arcs, the polygons formed by their chords, that is, the circles themselves, are regular polygons of the same number of sides, and are therefore similar (II. 33); and the apothems of the polygons are the radii of the circles; therefore the circumferences of the circles are as their radii (II. 36), or as twice their radii, that is, as their diameters; and the circles themselves as the squares of their radii, or the squares of their diameters.

**29.** *Cor. 1.* If  $C$  and  $c$  denote the circumferences,  $R$  and  $r$  the corresponding radii, and  $D$  and  $d$  the corresponding diameters, we have

$$C : c = R : r = D : d$$

or  $C : R = c : r$

and  $C : D = c : d$

That is, the ratio of the circumference of every circle to its radius or to its diameter is the same, that is, is constant. The constant ratio of the circumference to its diameter is denoted by  $\pi$  (the Greek letter  $p$ ).

**30.** *Cor. 2.*

$$\frac{C}{D} = \pi$$

$$C = \pi D = 2 \pi R$$

## THEOREM X.

**31.** *The area of a circle is equal to half the product of its circumference and its radius.*

The area of a regular polygon is half the product of its perimeter and its apothem (II. 37); a circle is a regular polygon

of an infinite number of sides (26); the circumference of the circle is the perimeter of the polygon, and its radius is the apothem; therefore the area of a circle is half the product of its circumference and its radius.

**32. Corollary.** If  $C$  = the circumference,  $D$  = the diameter,  $R$  = the radius, and  $A$  = the area of a circle, we have

$$A = \frac{1}{2} C \times R$$

But (30)

$$C = 2\pi R = \pi D$$

Therefore

$$A = \frac{1}{2} \times 2\pi R \times R = \pi R^2$$

or

$$A = \frac{1}{2} \pi D \times \frac{D}{2} = \frac{1}{4} \pi D^2$$

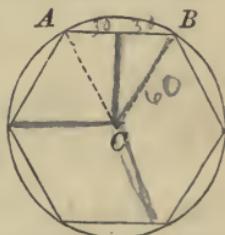

THEOREM XI.

$$\begin{aligned} C &= 2\pi R \\ C &= \pi D \\ A &= \pi r^2 \end{aligned}$$

**33. The side of a regular hexagon inscribed in a circle is equal to the radius of the circle.**

In the circle whose centre is  $C$  draw the chord  $AB$  equal to the radius;  $AB$  is the side of a regular hexagon inscribed in a circle.

Draw the radii  $CA$  and  $CB$ ;  $CAB$  is an equilateral, and therefore an equiangular triangle; hence the angle  $C$  is equal to one third of two right angles, or one sixth of four right angles; that is, the arc  $AB$  is one sixth of the whole circumference, or the chord  $AB$  the side of a regular hexagon inscribed in the circle (12 and 24).

**34. Corollary.** The chord of half the arc  $AB$  would be the side of a regular dodecagon; the chord of one quarter of the arc  $AB$ , the side of a regular polygon of twenty-four sides; and so on.

## PROPOSITION XII.

## PROBLEM.

**35.** *The chord of an arc given to find the chord of half the arc.*

Let  $AB$  be the given chord,  $AD$  the chord of half the arc  $ADB$ , and  $R$  denote the radius.

Draw the diameter  $DF$ , the radius  $AC$ , and the chord  $AF$ . The triangle  $ADF$  is right angled at  $A$  (23); then (II. 25)

$$DF : AD = AD : DE$$

$$\text{or } AD^2 = DF \times DE = 2R \times DE$$

$$\text{and } AD = \sqrt{2R \times DE}$$

$$\text{Now } DE = DC - CE = R - CE$$

$$\text{and (II. 28)} \quad CE = \sqrt{AC^2 - AE^2} = \sqrt{R^2 - AE^2}$$

$$\text{therefore } DE = R - \sqrt{R^2 - AE^2}$$

Substituting this value of  $DE$  in

$$AD = \sqrt{2R \times DE}$$

we have

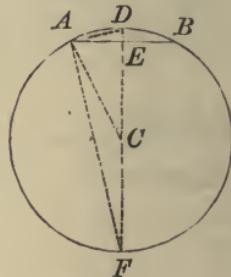

$$AD = \sqrt{2R^2 - 2R\sqrt{R^2 - AE^2}}$$

**36.** *Cor. 1.* If  $C$  denote the given chord,  $c$  the chord of half the arc, the equation becomes

$$\begin{aligned} c &= \sqrt{2R^2 - 2R\sqrt{R^2 - \frac{C^2}{4}}} \\ &= \sqrt{2R^2 - R\sqrt{4R^2 - C^2}} \end{aligned}$$

**37.** *Cor. 2.* If the diameter  $D$ , that is,  $2R$ , is unity, the equation in (36) becomes

$$c = \sqrt{\frac{1}{2} - \frac{1}{2}\sqrt{1 - C^2}}$$

## PROPOSITION XIII.

## PROBLEM.

**38.** To find the arithmetical value of the constant  $\pi$ .

From (30)  $C = \pi D$ ; if  $D = 1$ , this equation becomes  $C = \pi$ . If then we can find the circumference of a circle whose diameter is unity, we shall have the value of  $\pi$ .

If the diameter is unity, radius is one half, and the side of a regular hexagon inscribed in the circle is one half (33), and the perimeter of the hexagon is  $6 \times \frac{1}{2} = 3$ .

As the diameter is unity, and the side of the inscribed hexagon one half, we can find the side of the regular inscribed dodecagon from the equation in (37):

$$\begin{aligned} c &= \sqrt{\frac{1}{2} - \frac{1}{2}\sqrt{1 - \frac{1}{4}}} \\ &= \sqrt{\frac{1}{2} - \frac{1}{2}\sqrt{.75}} \\ &= \sqrt{.5 - .433} \\ &= \sqrt{.067} = .2588+ \end{aligned}$$

The perimeter of the inscribed dodecagon is therefore  $12 \times .2588+ = 3.105+$ .

By using the side of the dodecagon  $= .2588+$ , as  $C$ , or  $.067 = C^2$ , from the same equation we can find the side of a regular inscribed polygon of twenty-four sides:

$$\begin{aligned} c &= \sqrt{\frac{1}{2} - \frac{1}{2}\sqrt{1 - .067}} \\ &= \sqrt{\frac{1}{2} - \frac{1}{2}\sqrt{.933}} \\ &= \sqrt{.5 - .483} \\ &= \sqrt{.017} = .13038 \end{aligned}$$

The perimeter of the inscribed polygon of twenty-four sides is therefore  $24 \times .13038 = 3.129$ .

By continuing this process we approximate to the circumference, that is, to the value of  $\pi$ .

**39. Scholium.** By other more expeditious methods the value of  $\pi$  has been found accurately to two hundred and fifty places of decimals. For practical purposes it is sufficiently accurate to call  $\pi = 3.14159$ .

### PRACTICAL QUESTIONS.

1. What is the circumference of a circle whose radius is 10 feet?  $20 \times 314$
  2. What is the diameter of a circle whose circumference is 57 rods?
  3. What is the area of a circle whose radius is 40 feet?
  4. What is the area of a circle whose circumference is 18 inches?
  5. What is the circumference of a circle whose area is 116 square feet?
  6. The radii of two concentric circles are 40 and 54 feet; what is the area of the space bounded by their circumferences?
  7. A has a circular lot of land whose diameter is 95 rods, and B a similar lot whose area is 750 square rods; compare these lots.
  8. What is the difference between the perimeters of two lots of land each containing an acre, if one is a square and the other a circle?
  9. What is the area of a square inscribed in a circle whose area is a square metre?
  10. What is the area of a regular hexagon inscribed in a circle whose area is 567 square feet.
  11. If a rope an inch in diameter will support 1,000 pounds, what must be the diameter of a rope of like material to support 4,000 pounds?
  12. If a pipe an inch in diameter will fill a cistern in 25 minutes, how long will it take a pipe 5 inches in diameter?
  13. If a pipe an inch in diameter will empty a cistern in an hour, how long will it take this pipe to empty the cistern if there is another pipe one third of an inch in diameter through which the fluid runs in?
- Ans.  $67\frac{1}{2}$  minutes.
14. If a pipe 3 inches in diameter will empty a cistern in 3 hours, how long will it take the pipe to empty the cistern if there are 3 other pipes each an inch in diameter through which the fluid runs in?
- Ans.  $4\frac{1}{2}$  hours.

EXERCISES.

The following Theorems, depending for their demonstration upon those already demonstrated, are introduced as exercises for the pupil. In some of them references are made to the propositions upon which the demonstration depends. They are not connected with the propositions in the following books, and can be omitted if thought best.

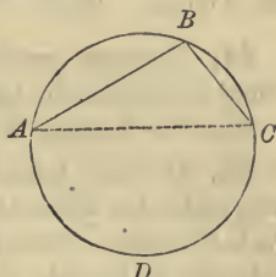

- 40.** Every diameter bisects the circle and the circumference.
- 41.** A straight line can meet the circumference of a circle in only two points. (4.) (I. 51.)

**42.** The diameter is greater than any other chord of the circle.

**43.** In the same or equal circles, when the sum of the arcs is less than a circumference, the greater arc is subtended by the greater chord; and, conversely, the greater chord is subtended by the greater arc.

Draw  $AC$ . (21.) (I. 47.)

What is the case when the sum of the arcs is greater than a circumference?

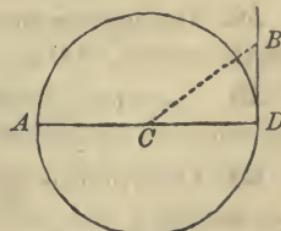

**44.** In the same circle equal chords are equally distant from the centre; and of two unequal chords the greater is nearer the centre.

**45.** The shortest and the longest line that can be drawn from any point to a given circumference lies on the line that passes from the point to the centre of the circle.

**46.** Two parallels cutting the circumference of a circle intercept equal arcs.

**47.** A straight line perpendicular to a diameter at its extremity is a tangent to the circumference.

Draw  $CB$ . (I. 51.)

**48.** The lines joining the extremities of two diameters are parallel.

**49.** If the extremities of two chords are joined, the vertical, or opposite, triangles thus formed are similar.

**50.** If two circumferences cut each other, the chord which joins their points of intersection is bisected at right angles by the line joining their centres. (17.)

**51.** If two circumferences touch each other, their centres and point of contact are in the same straight line, perpendicular to the tangent at the point of contact. (47.)

**52.** The distance between the centres of two circles whose circumferences cut one another, is less than the sum, but greater than the difference, of their radii.

**53.** Every angle inscribed in a segment greater than a semicircle is acute; and every angle inscribed in a segment less than a semicircle is obtuse. (21.)

**54.** The angle made by a tangent and a chord is measured by half the included arc.

Draw the diameter  $A B$ . (47.) (21.)

**55.** The angle formed by two chords cutting each other within the circle is measured by half the sum of the arcs intercepted by its sides and by the sides of its vertical angle.

Join  $B C$  (in lower figure). (21.)

**56.** By moving the point of intersection of the two chords, show that (14) and (21) can be deduced from (55).

**57.** The segments of two chords intersecting within a circle are reciprocally proportional; that is,  $A E : B E = E D : E C$ .

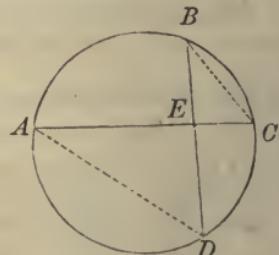

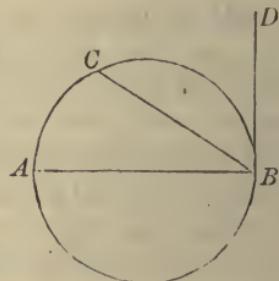

Join  $A D, B C$ . (21.) (II. 20.)

**58.** The opposite angles of a quadrilateral inscribed in a circle are supplementary. (21.)

**59.** A quadrilateral whose opposite angles are supplementary, and no other, can be inscribed in a circle.

**60.** Lines through the point of contact of two circumferences that are tangent to each other are cut proportionally by these circumferences. (22.) (II. 20.)

**61.** The area of a sector is equal to half the product of its arc by the radius of the circle. (31.)

**62.** Show how to find the area of a segment of a circle.

**63.** The area of a circumscribed polygon is equal to half the product of its perimeter by the radius of the circle.

**64.** A tangent is a mean proportional between a secant drawn from the same point and the part of the secant without the circle.

Join  $AD, DC$ . (54; 21.) (II. 57.)

**65.** The angle formed by two secants, two tangents, or a secant and a tangent cutting each other without the circle, is measured by half the difference of the intercepted arcs.

Join  $CF$ . (I. 39.) (21.)

**66.** By moving the point of intersection, show that (21) can be deduced from (65). Show also that (46) can be deduced from (65).

**67.** Two secants drawn from the same point are to each other inversely as the parts of the secants without the circle.

Join  $CF, DG$ . (21.) (II. 57.)

**68.** Two tangents drawn to a circumference from the same point are equal.

Join  $BE$ . Figure in (66.) (54.)

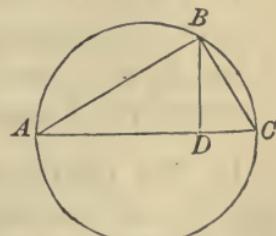

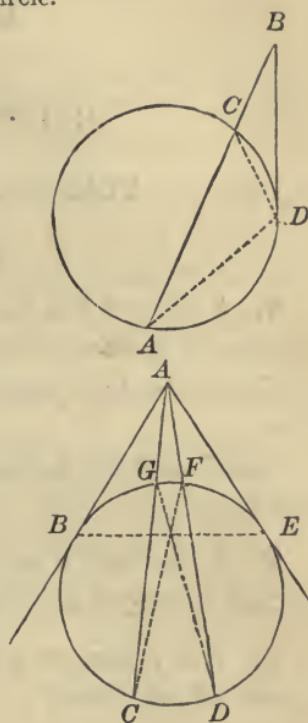

**69.** A perpendicular from a circumference to the diameter is a mean proportional between the segments of the diameter.

Join  $AB, BC$ . (23.) (II. 26.)

**70.** If from one end of a chord a diameter is drawn, and from the other end a perpendicular to this diameter, the chord is a mean proportional between the diameter and the adjacent segment of the diameter.

Join  $AB$ . (23.) (II. 25.)

**71.** The sum of the opposite sides of a circumscribed quadrilateral is equal to the sum of the other two sides. (68.)

## BOOK IV.

### GEOMETRY OF SPACE.

#### PLANES AND THEIR ANGLES.

##### DEFINITIONS.

1. A straight line is *perpendicular to a plane* when it is perpendicular to every straight line of the plane which it meets.

*Conversely*, the plane, in this case, is perpendicular to the line.

The *foot* of the perpendicular is the point in which it meets the plane.

2. A *line and a plane are parallel* when they cannot meet though produced indefinitely.

3. Two *planes are parallel* when they cannot meet though produced indefinitely.

##### THEOREM I.

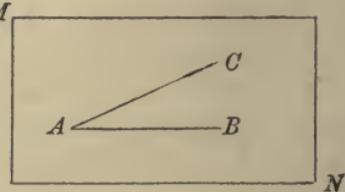

4. *A plane is determined,*

1st. *By a straight line and a point without that line;*

2d. *By three points not in the same straight line;*

3d. *By two intersecting straight lines.*

1st. Let the plane  $MN$ , passing through the line  $AB$ , turn upon this line as an axis until it contains the point  $C$ ; the position of the plane is evidently determined; for if it is turned in either direction it will no longer contain the point  $C$ .

2d. If three points,  $A, B, C$ , not in the same straight line are given, any two of them, as  $A$  and  $B$ , may be joined by a straight line; then this is the same as the 1st case.

3d. If two intersecting lines  $AB, AC$  are given, any point,  $C$ , out of the line  $AB$  can be taken in the line  $AC$ ; then the plane passing through the line  $AB$  and the point  $C$  contains the two lines  $AB$  and  $AC$ , and is determined by them.

**5. Corollary.** The intersection of two planes is a straight line; for the intersection cannot contain three points not in the same straight line, since only one plane can contain three such points.

### THEOREM II.

**6. Oblique lines from a point to a plane equally distant from the perpendicular are equal; and of two oblique lines unequally distant from the perpendicular, the more remote is the greater.**

Let  $AC, AD$  be oblique lines drawn to the plane  $MN$  at equal distances from the perpendicular  $AB$ :

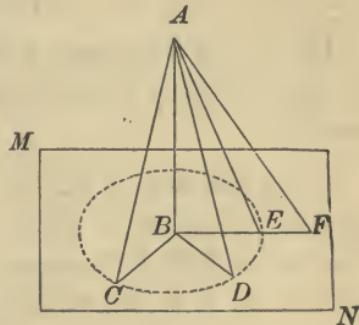

1st.  $AC = AD$ ; for the triangles  $ABC, ABD$  are equal (I. 40).

2d. Let  $AF$  be more remote. From  $BF$  cut off  $BE = BD$  and draw  $AE$ ; then  $AF > AE$

(I. 51); and  $AE = AD = AC$ ; therefore  $AF > AD$  or  $AC$ .

**7. Cor. 1.** *Conversely*, equal oblique lines from a point to a plane are equally distant from the perpendicular; therefore they meet the plane in the circumference of a circle whose centre is the foot of the perpendicular. Of two unequal lines the greater is more remote from the perpendicular.

**8. Cor. 2.** The perpendicular is the shortest distance from a point to a plane.

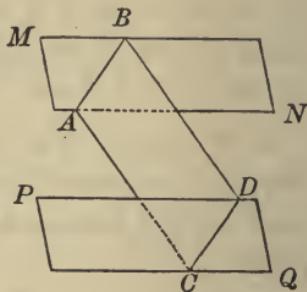

## THEOREM III.

**9.** *The intersections of two parallel planes with a third plane are parallel.*

Let  $A B$  and  $C D$  be the intersections of the plane  $A D$  with the parallel planes  $M N$  and  $P Q$ ; then  $A B$  and  $C D$  are parallel.

For the lines  $A B$  and  $C D$  cannot meet though produced indefinitely, since the planes  $M N$  and  $P Q$  in which they are cannot meet; and they are in the same plane  $A D$ ; therefore they are parallel.

**10. Corollary.** Parallels intercepted between parallel planes are equal. For the opposite sides of the quadrilateral  $A D$  being parallel, the figure is a parallelogram; therefore  $A C = B D$ .

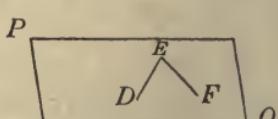

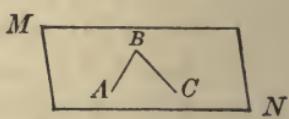

## THEOREM IV.

**11.** *If two angles not in the same plane have their sides parallel and similarly situated, the angles are equal and their planes parallel.*

Let  $A B C$  and  $D E F$  be two angles in the planes  $M N$  and  $P Q$ , having their sides  $A B$ ,  $B C$  respectively parallel to  $D E$ ,  $E F$ , and similarly situated; then

1st. Since  $B A$  has the same direction as  $E D$ , and  $B C$  the same as  $E F$ , the difference of direction of  $B A$  and  $B C$  must be the same as the difference of direction of  $E D$  and  $E F$ ; that is, angle  $B = \text{angle } E$ .

2d. The planes of these angles are parallel. For, since two intersecting lines determine a plane (4), the plane of the lines  $A B$  and  $B C$  must be parallel to the plane of the lines  $D E$  and  $E F$ , as  $A B$  and  $B C$  are respectively parallel to  $D E$  and  $E F$ .

## THEOREM V.

**12.** If two straight lines are cut by parallel planes, they are divided proportionally.

Let  $A B$  and  $C D$  be cut by the parallel planes  $M N$ ,  $P Q$ , and  $R S$ , in the points  $A$ ,  $E$ ,  $B$ , and  $C$ ,  $F$ ,  $D$ ; then

$$AE : EB = CF : FD$$

For, drawing  $A D$  meeting the plane  $P Q$  in  $G$ , the plane of the lines  $A B$  and  $A D$  cuts the parallel planes  $P Q$  and  $R S$  in  $EG$  and  $BD$ ; therefore  $EG$  and  $BD$  are parallel (9), and we have (II. 16)

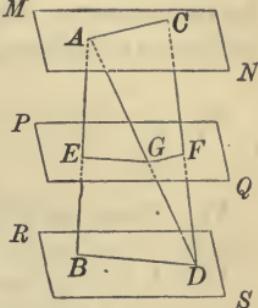

$$AE : EB = AG : GD$$

The plane of the lines  $A D$  and  $C D$  cuts the parallel planes  $M N$  and  $P Q$  in  $AC$  and  $GF$ ; therefore  $AC$  is parallel to  $GF$ ; and we have

$$AG : GD = CF : FD$$

Hence we have (Pn. 11)

$$AE : EB = CF : FD$$

**EXERCISES.**

The following Theorems, depending for their demonstration upon those already demonstrated, are introduced as exercises for the pupil. In some of them references are made to the propositions upon which the demonstration depends. They are not connected with the propositions in the following books, and can be omitted if thought best.

- 13.** An infinite number of planes can pass through a given line. (4.)
- 14.** There can be but one perpendicular from a point to a plane.
- 15.** A line perpendicular to each of two lines at their point of intersection is perpendicular to the plane of these lines. (4.) (I. 76.)
- 16.** Parallel lines are equally inclined to the same plane.
- 17.** State the converse of (16). Is it true?
- 18.** Lines parallel to a line in a given plane are parallel to the plane.
- 19.** State the converse of (18). Is it true?
- 20.** Parallel planes are equally inclined to the same straight line.
- 21.** State the converse of (20). Is it true?

## BOOK V.

### POLYEDRONS.

#### DEFINITIONS.

**1.** A Polyedron is a solid bounded by planes.

The bounding planes are called *faces*; their intersections, *edges*; the intersections of the edges, *vertices*.

**2.** The Volume of a solid is the measure of its magnitude. It is expressed in units which represent the number of times it contains the cubical unit taken as a standard.

**3.** Equivalent Solids are those which are equal in volume.

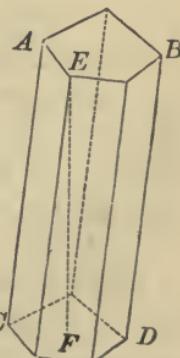

**4.** Similar Solids are those whose homologous lines have a constant ratio. (*Corollary.*) It follows that similar solids are bounded by the same number of similar polygons similarly situated.

### PRISMS AND CYLINDERS.

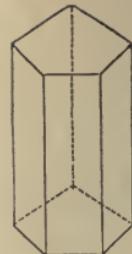

**5.** A Prism is a polyedron two of whose faces are equal polygons having their homologous sides parallel, and the other faces parallelograms. (*Corollary.*) The lateral edges are equal.

The equal parallel polygons are called *bases*; as *AB* and *CD*.

**6.** The Altitude of a prism is the perpendicular distance between its bases; as *EF*.

**7. A Right Prism** is one whose other faces are perpendicular to its bases. (*Corollary*) Its lateral faces are rectangles.

**8. A prism** is called *triangular*, *quadrangular*, or *pentagonal*, according as its base is a triangle, a quadrangle, or a pentagon; and so on.

**9. A Parallellopiped** is a prism whose bases are parallelograms. (*Corollary*.) It follows that all its faces are parallelograms.

**A Right Parallellopiped** is a *right* prism whose bases are parallelograms.

**10. A Rectangular Parallellopiped** is a right parallelopiped whose bases are rectangles.

(*Corollary*.) All its faces are rectangles.

**11. A Cube** is a parallellopiped whose faces are all squares. (*Corollary*.) It follows that its faces are all equal, and the parallellopiped rectangular.

**12. A Cylinder** is a right prism whose bases are regular polygons of an infinite number of sides, that is, whose bases are circles. A cylinder can be described by the revolution of a rectangle about one of its sides which remains fixed. The side opposite the fixed side describes the *convex surface*, and the other two sides the two circular bases. Thus the rectangle  $ABCD$  revolving about  $BC$  would describe the cylinder, the side  $AD$  the convex surface, and  $AB, DC$  the circular bases.

**13. The Axis** of a cylinder is the straight line joining the centres of the two bases; or it is the fixed side of the rectangle whose revolution describes the cylinder; as  $BC$ .

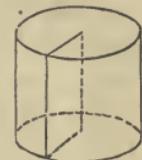

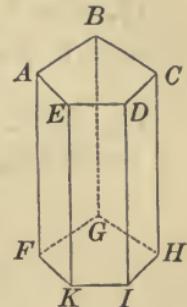

## THEOREM I.

**14.** *The convex surface of a right prism is equal to the perimeter of its base multiplied by its altitude.*

Let  $AH$  be a right prism; its convex surface is equal to  $FG + GH + HI + IK + KF$  multiplied by its altitude  $AF$ .

For the convex surface is equal to the sum of the rectangles  $AG, BH, CI, \text{ &c.}$  The area of the rectangle  $AG = FG \times AF$ ; the area of  $BH = GH \times BG$ ; of  $CI = HI \times CH$ ; and so on. But the edges  $AF, BG, CH, \text{ &c.}$  are equal to each other and to the altitude of the prism; and the bases of these rectangles together form the perimeter of the prism. Therefore the sum of these rectangles, that is, the convex surface of the right prism, is equal to the perimeter of its base multiplied by its altitude.

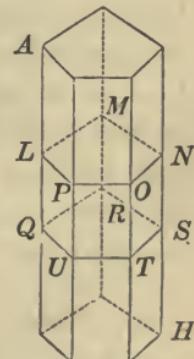

**15. Corollary.** As a cylinder is a right prism (12), this demonstration includes the cylinder. If, then,  $R =$  the radius of the base, and  $A =$  the altitude of a cylinder, the convex surface  $= 2\pi RA$ .

## THEOREM II.

**16.** *The sections of a prism made by parallel planes are equal polygons.*

Let the prism  $AH$  be intersected by the parallel planes  $LN$  and  $QS$ ; then  $LN$  and  $QS$  are equal polygons. For  $LM, MN, NO, \text{ &c.}$  are respectively parallel to  $QR, RS, ST, \text{ &c.}$  (IV. 9), and similarly situated; therefore the angles  $L, M, N, O, P$  are respectively equal to the angles  $Q, R, S, T, U$  (IV. 11); and the polygons  $LN$  and  $QS$  are mutually equiangular. Also the sides  $LM, MN, NO, \text{ &c.}$  are

respectively equal to  $Q R, R S, S T, \&c.$  (I. 62). Therefore the polygons, being mutually equiangular and equilateral, are equal (II. 6).

**17.** *Cor. 1.* A section made by a plane parallel to the base is equal to the base.

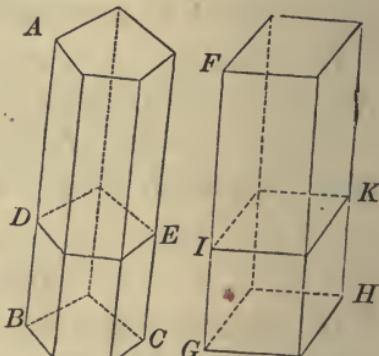

**18.** *Cor. 2.* A section of a cylinder made by a plane parallel to the base is a circle equal to the base.

### THEOREM III.

**19.** *Prisms having equivalent bases and equal altitudes are equivalent.*

Let  $A C$  and  $F H$  be two prisms having equal altitudes and their bases  $B C, G H$  equivalent; the prisms are equivalent.

Let  $D E$  and  $I K$  be sections made by planes respectively parallel to the bases  $B C$  and  $G H$ ; these sections are respectively equal to the bases (17); therefore the section  $D E$  is equivalent to  $I K$ , at whatever distance from the base either may be. If, therefore, the planes of these sections move, remaining always parallel to the bases, as the sections will always be equivalent, it is evident that in moving over an equal length of altitude the sections will move over equal volumes; therefore, as the altitudes are equal, the prisms are equivalent.

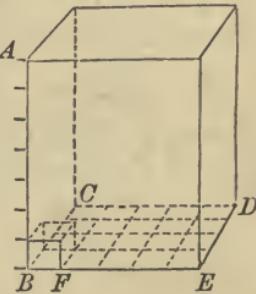

**20.** *Corollary.* Any prism is therefore equivalent to a rectangular prism having an equivalent base and an equal altitude.

## THEOREM IV.

**21.** *The volume of a rectangular parallelopiped is equal to the product of its three dimensions.*

Let  $AD$  be a rectangular parallelopiped; then its volume is equal to  $BC \times BE \times BA$ . Suppose  $BF$ , the linear unit, is contained in  $BC$  four times, in  $BE$  five times, and in  $BA$  seven times; then dividing  $BC$ ,  $BE$ ,  $BA$  respectively into four, five, and seven equal parts, and passing planes through the several points of division parallel to the sides of the parallelopiped, there will be formed a number of cubes equal to each other (19), and each equal to the cube whose edge is the linear unit. It is evident also that the whole number of cubes is equal to the product of the three dimensions, or  $4 \times 5 \times 7 = 140$ . This demonstration is applicable, whatever the number of units in the linear dimensions may be. Therefore the volume of a rectangular parallelopiped is equal to the product of its three dimensions.

**22.** *Scholium.* If the three dimensions are incommensurable, the linear unit can be taken infinitely small, that is, so small that the remainder will be infinitesimal and can be neglected.

**23.** *Cor. 1.* As the base is equal to  $BC \times BE$ , the volume of a rectangular parallelopiped is equal to the product of its base by its altitude.

**24.** *Cor. 2.* The volume of a cube is equal to the cube of its edge.

## SOLID GEOMETRY.

### THEOREM V.

**25.** *The volume of any prism is equal to the product of its base by its altitude.*

For any prism is equivalent to a rectangular parallelopiped, having an equivalent base and the same altitude (20); and the volume of the equivalent rectangular parallelopiped is equal to the product of its base by its altitude; therefore the volume of any prism is equal to the product of its base by its altitude.

**26. Corollary.** As a cylinder is a right prism, this demonstration includes the cylinder. If, therefore,  $R$  = the radius of base,  $A$  = the altitude, and  $V$  = the volume of a cylinder,

$$V = \pi R^2 A = \frac{1}{4} \pi D^2 A$$

### THEOREM VI.

**27.** *Similar prisms are as the cubes of their homologous lines.*

Let  $AD$  and  $EH$  be similar prisms whose altitudes are  $IK$  and  $MN$ . Let  $V$  represent the volume of  $AD$ , and  $v$  the volume of  $EH$ ; then

$$\begin{aligned} V : v &= IK^3 : MN^3 = AC^3 : EG^3 \\ &= CO^3 : GP^3 \end{aligned}$$

For (25)  $V = CD \times IK$  and  $v = GH \times MN$ , therefore

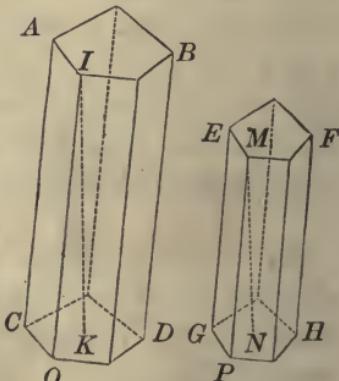

$$V : v = CD \times IK : GH \times MN$$

$$\begin{aligned} \text{But (II. 31)} \quad CD : GH &= CO^2 : GP^2 \\ \text{and (4)} \quad IK : MN &= CO : GP \end{aligned}$$

Multiplying the last two proportions together we have

$$\begin{aligned} CD \times IK : GH \times MN &= CO^3 : GP^3 \\ \text{therefore (Pn. 11)} \quad V : v &= CO^3 : GP^3 \end{aligned}$$

But in similar solids homologous lines have a constant ratio (4); therefore  $V : v$  as the cubes of any homologous lines.

## PYRAMIDS AND CONES.

## DEFINITIONS.

**28.** A **Pyramid** is a polyedron bounded by a polygon called the base, and by triangular planes meeting at a common point called the vertex.

**29.** A pyramid is called *triangular, quadrangular, pentagonal*, according as its base is a triangle, a quadrangle, or a pentagon ; and so on.

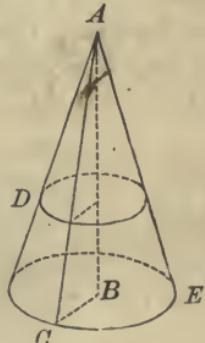

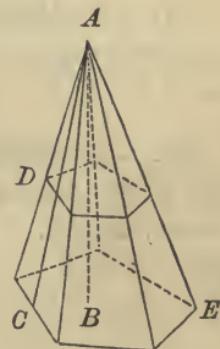

**30.** The **Altitude** of a pyramid is the perpendicular distance from its vertex to its base ; as  $A B$ .

**31.** A **Right Pyramid** is one whose base is a regular polygon and in which the perpendicular from the vertex passes through the centre of the base.

**32.** The **Slant Height** of a right pyramid is the perpendicular distance from the vertex to the base of any one of its lateral faces ; as  $A C$ .

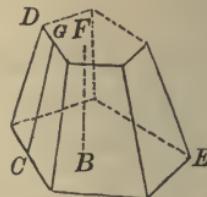

**33.** A **Cone** is a right pyramid whose base is a regular polygon of an infinite number of sides, that is, whose base is a circle. A cone can be described by the revolution of a right triangle about one of its sides which remains fixed. The other side describes the circular base, and the hypotenuse the *convex surface*. Thus the right triangle  $A B C$  revolving about  $A B$  would describe the cone,  $B C$  the base, and the hypotenuse  $A C$  the convex surface.

**34.** The **Axis** of a cone is the line from the vertex to the centre of the base ; or it is the fixed side of the right triangle whose revolution describes the cone ; as  $A B$ .

**35. Corollary.** The axis of a cone is perpendicular to the base, and is therefore the *altitude* of the cone.

**36. A Frustum** of a pyramid is a part of the pyramid included between the base and a plane cutting the pyramid parallel to the base ; as *D E*.

**37. The Altitude** of a frustum is the perpendicular distance between the two parallel planes or bases ; as *F B*.

**38. The Slant Height** of a frustum of a right pyramid is the perpendicular distance between the parallel edges of the bases ; as *G C*.

### THEOREM VII.

**39. If a pyramid is cut by a plane parallel to its base,**

- 1st. *The edges and altitude are divided proportionally ;*
- 2d. *The section is a polygon similar to the base.*

Let *A-BCDEF* be a pyramid whose altitude is *AN*, cut by a plane *GI* parallel to the base ; then

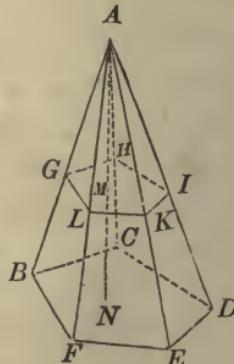

1st. The edges and the altitude are divided proportionally.

For suppose a plane passed through the vertex *A* parallel to the base ; then the edges and altitude, being cut by three parallel planes, are divided proportionally (IV. 12), and we have

$$AB : AG = AC : AH = AD : AI = AN : AM$$

2d. The section *GI* is similar to the base *BD*.

For the sides of *GI* are respectively parallel to the sides of *BD* (IV. 9), and similarly situated ; therefore the polygons *GI*, *BD* are mutually equiangular. Also, as *GL* is parallel to *BF*,

and  $LK$  to  $FE$ , the triangles  $ABF$  and  $AGL$  are similar, and the triangles  $AFE$  and  $ALK$ ; therefore

$$GL : BF = AL : AF, \text{ and } LK : FE = AL : AF$$

Therefore  $GL : BF = LK : FE$

In the same manner we should find

$$LK : FE = KI : ED = IH : DC, \text{ &c.}$$

Therefore the polygons  $GI$  and  $BD$  are similar (II. 19).

**40. Corollary.** A section of a cone made by a plane parallel to the base is a circle.

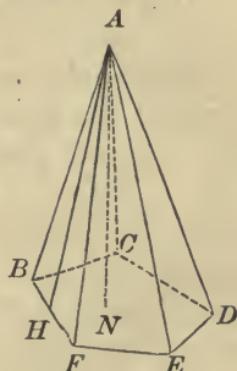

X

### THEOREM VIII.

**41.** *The convex surface of a right pyramid is equal to the perimeter of its base multiplied by half its slant height.*

Let  $A-BCDEF$  be a right pyramid whose slant height is  $AH$ ; its convex surface is equal to  $BC + CD + DE + EF + FB$  multiplied by half of  $AH$ .

The edges  $AB$ ,  $AC$ ,  $AD$ ,  $AE$ ,  $AF$ , being equally distant from the perpendicular  $AN$  (II. 34), are equal (IV. 6); and the bases  $BC$ ,  $CD$ ,  $DE$ , &c. are equal; therefore the isosceles triangles  $ABC$ ,  $ACD$ ,  $ADE$ , &c. are all equal (I. 48); and their altitudes are equal. The area of  $ABC$  is  $BC \times \frac{1}{2}AH$  (II. 11); of  $ACD$  is  $CD \times \frac{1}{2}AH$ ; and so on. Therefore the sum of the areas of these triangles, that is, the convex surface of the right pyramid, is  $(BC + CD + DE + EF + FB) \frac{1}{2}AH$ .

**42. Corollary.** As a cone is a right pyramid (33), this demonstration includes the cone. If, therefore,  $R$  = the radius of the base, and  $S$  = the slant height of a cone,

$$\text{its convex surface} = 2\pi R \frac{1}{2}S = \pi RS$$

If a plane parallel to the base and bisecting the altitude be

drawn, as the section will be a circle (40) with a radius and circumference one half the radius and circumference of the base, therefore, if  $r'$  = the radius of this section,

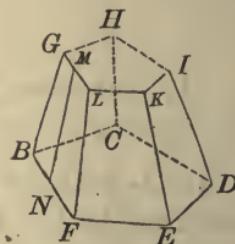

$$\text{the convex surface} = 2\pi r' S$$

#### K THEOREM IX.

**43.** *The convex surface of a frustum of a right pyramid is equal to the sum of the perimeter of its two bases multiplied by half its slant height.*

Let  $GD$  be the frustum of a right pyramid; its convex surface is equal to  $GH + HI + IK + KL + LG + BC + CD + DE + EF + FB$  multiplied by half  $MN$ .

The lateral faces of a frustum of a right pyramid are equal trapezoids (39; II. 6); and their altitudes are all equal. The area of  $GC$  (II. 14) is  $(GH + BC) \times \frac{1}{2}MN$ ; of  $HD$  is  $(HI + CD) \times \frac{1}{2}MN$ ; and so on. Therefore the sum of the areas of these trapezoids, that is, the convex surface of the frustum of the right pyramid, is  $GH + HI + IK + KL + LG + BC + CD + DE + EF + FB$  multiplied by half  $MN$ .

**44. Cor. 1.** If the frustum is cut by a plane parallel to its two bases, and at equal distances from each base, this plane will bisect the edges  $GB$ ,  $HC$ ,  $ID$ , &c. (39); and the area of each trapezoid is equal to its altitude multiplied by the line joining the middle points of the sides which are not parallel (II. 15). Therefore the convex surface of a frustum of a right pyramid is equal to the perimeter of a section midway between the bases multiplied by its slant height.

**45. Cor. 2.** As a cone is a right pyramid (33), this demonstration includes the frustum of a cone. If, therefore,  $R$  and

$r$  = the radii of the two bases of the frustum of a cone, and  
 $S$  = its slant height,

$$\text{its convex surface} = (2\pi R + 2\pi r) \frac{1}{2} S = (\pi R + \pi r) S$$

If  $r'$  = the radius of a section midway between and parallel to the bases,

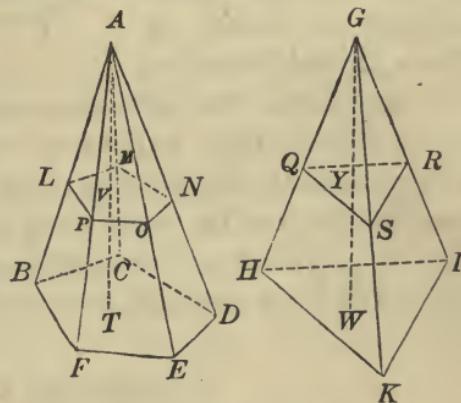

$$\text{the convex surface} = 2\pi r' S$$

### THEOREM X.

**46.** *If two pyramids having equal altitudes are cut by planes parallel to their bases and at equal distances from their vertices, the sections are to each other as their bases.*

Let  $A - B C D E F$  and  $G - H I K$  be two pyramids of equal altitudes  $AT, GW$ , cut by the planes  $L M N O P$  and  $Q R S$  parallel respectively to the bases and at equal distances from the vertices  $A$  and  $G$ , then

$$L M N O P : Q R S = B C D E F : H I K$$

For as the polygons  $L M N O P$  and  $B C D E F$  are similar (39)  
 $L M N O P : B C D E F = \overline{L P}^2 : \overline{B F}^2 = \overline{A L}^2 : \overline{A B}^2 = \overline{A V}^2 : \overline{A T}^2$

In like manner

$$Q R S : H I K = \overline{G Y}^2 : \overline{G W}^2$$

But as  $A V = G Y$  and  $A T = G W$   
therefore

$$L M N O P : B C D E F = Q R S : H I K$$

or (Pn. 15)

$$L M N O P : Q R S = B C D E F : H I K .$$

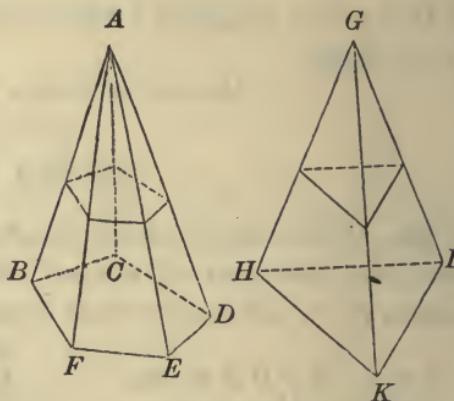

**47. Corollary.** If two pyramids have equal altitudes and equivalent bases, sections made by planes parallel to their bases and at equal distances from their vertices are equivalent.

## THEOREM XI.

*48. Pyramids having equivalent bases and the same altitude are equivalent.*

Let  $A-B C D E F$  and  $G-H I K$  be pyramids having equivalent bases and equal altitudes; then the two pyramids are equivalent.

For, if at equal distances from the vertex sections are formed by planes parallel respectively

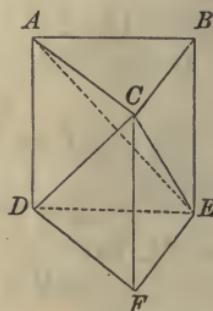

to their bases, these sections are equivalent (47). If now the planes forming these sections be supposed to move, remaining always parallel to the bases, and each keeping the same distance from the vertex as the other, these sections, always being equivalent to each other, will move over equal volumes; therefore, as the altitudes are equal, the pyramids must be equivalent.

## THEOREM XII.

*49. A triangular pyramid is one third of a triangular prism of the same base and altitude.*

Let  $C-D E F$  be a triangular pyramid and  $A B C-D E F$  be a triangular prism on the same base  $D E F$ ; then  $C-D E F$  is one third of  $A B C-D E F$ .

Taking away the pyramid  $C-D E F$  there remains the quadrangular pyramid whose vertex is  $C$  and base the parallelogram  $A B E D$ . Through the points  $A, C, E$  pass a plane; it will divide the pyramid  $C-A B E D$  into two triangular pyramids, which are equivalent to each other (48), since their bases are halves of the parallelogram  $A B E D$ , and they have the

same altitude, the perpendicular from their vertex  $C$  to the base  $A B E D$ . But the pyramid  $C-A B E$ , that is,  $E-A B C$ , is equivalent to the pyramid  $C-D E F$ , as they have equal bases  $A B C$  and  $D E F$ , and the same altitude (48). Therefore the three pyramids are equivalent and the given pyramid is one third of the prism.

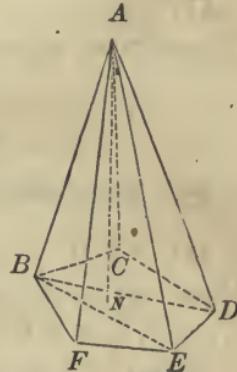

**50. Corollary.** The volume of a triangular pyramid is equal to one third the product of its base by its altitude.

### THEOREM XIII.

**51.** *The volume of any pyramid is equal to one third of the product of its base by its altitude.*

Let  $A-B C D E F$  be any pyramid; its volume is equal to one third the product of its base  $B C D E F$  by its altitude  $A N$ .

Planes passing through the vertex  $A$  and the diagonals of the base  $B D$ ,  $B E$ , will divide the pyramid into triangular pyramids whose bases together compose the base of the given pyramid and which have as their common altitude  $A N$ , the altitude of the given pyramid. The volume of the given pyramid is equal to the sum of the volumes of the several triangular pyramids, which is equal to one third of the sum of their bases multiplied by their common altitude; that is, is equal to one third of the product of the base  $B C D F E$  by the altitude  $A N$ .

**52. Cor. 1.** As a cone is a right pyramid (33), this demonstration includes the cone. A cone, therefore, is one third of a cylinder, or of any prism, of equivalent base and the same altitude. If  $R$  = radius of the base,  $A$  = the altitude, and  $V$  = the volume of a cone,  $V = \frac{1}{3} \pi R^2 A$ .

**53. Cor. 2.** The ratio of similar pyramids to one another is the same as that of similar prisms; that is, as the cubes of homologous lines.

## THE SPHERE.

## DEFINITIONS.

**54.** A **Sphere** is a solid bounded by a curved surface, of which every point is equally distant from a point within called the *centre*. A sphere can be described by the revolution of a semicircle about its diameter which remains fixed.

**55.** The **Radius** of a sphere is the straight line from the centre to any point of the surface.

**56.** The **Diameter** of a sphere is a straight line passing through the centre and terminating at either end at the surface.

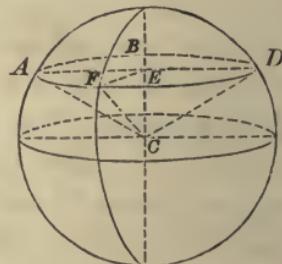

**57. Corollary.** All the radii of a sphere are equal; all the diameters are equal, and each is double the radius.

## THEOREM XIV.

**58.** Every section of a sphere made by a plane is a circle.

Let  $ABD$  be a section made by a plane cutting the sphere whose centre is  $C$ ; then is  $ABD$  a circle.

Draw  $CE$  perpendicular to the plane, and to the points  $A, D, F$ , where the plane cuts the surface of the sphere, draw  $CA, CD, CF$ . As  $CA, CD, CF$  are radii of the sphere they are equal, and are therefore equally distant from the foot of the perpendicular  $CE$  (IV. 7). Therefore  $EA, ED, EF$  are equal, and the section  $ABD$  is a circle whose centre is  $E$ .

**59. Corollary.** If the section passes through the centre of the sphere, its radius will be the radius of the sphere.

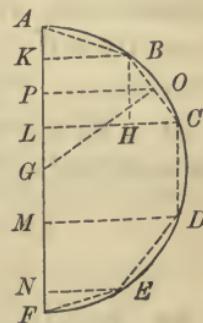

**60. Definition.** A section made by a plane passing through the centre of a sphere is called a *great circle*. A section made by a plane not passing through the centre is called a *small circle*.

## THEOREM XV.

**61.** *The surface of a sphere is equal to the product of its diameter by the circumference of a great circle.*

Let  $ABCDEF$  be the semicircle by whose revolution about the diameter  $AF$ , the sphere may be described; then the surface of the sphere is equal to the diameter  $AF$  multiplied by the circumference of the circle whose radius is  $GA$ , or  $= AF \times \text{circ. } GA$ .

Let  $ABCDEF$  be a regular semi-decagon inscribed in the semicircle. Draw  $GO$  perpendicular to one of its sides, as  $BC$ .

Draw  $BK, OP, CL, DM, EN$  perpendicular to the diameter  $AF$ , and  $BH$  perpendicular to  $CL$ . The surface described by  $BC$  is the convex surface of the frustum of a cone, and is equal to  $BC \times \text{circ. } PO$  (45). But the triangles  $BCH$  and  $POG$  are similar (II. 21); therefore

$$BC : BH \text{ or } KL = GO : PO$$

$$\text{or (III. 28)} \quad BC : KL = \text{circ. } GO : \text{circ. } PO$$

$$\therefore BC \times \text{circ. } PO = KL \times \text{circ. } GO$$

That is, the surface described by  $BC$  is equal to the altitude  $KL$  multiplied by  $\text{circ. } GO$ , or by the circumference of the circle inscribed in the polygon. In like manner it can be proved that the surfaces described by  $AB, CD, DE$ , and  $EF$  are respectively equal to their altitudes  $AK, LM, MN$ , and  $NF$  multiplied by  $\text{circ. } GO$ . Therefore the entire surface described by the semi-polygon will be equal to

$$(AK + KL + LM + MN + NF) \text{ circ. } GO = AF \times \text{circ. } GO$$

This demonstration is true, whatever the number of sides of the semi-polygon; it is true, therefore, if the number of sides is infinite, in which case the semi-polygon would coincide with the semicircle; and the surface described by the semi-polygon would be the surface of the sphere, and the radius of the in-

scribed polygon would be the radius of the sphere. Therefore we have the surface of the sphere equal to

$$A F \times \text{circ. } G A$$

**62. Corollary.** Let  $S$  = the surface of the sphere,  $C$  = the circumference,  $R$  = the radius,  $D$  = the diameter, then we have (III. 30)  $C = 2\pi R$ , or  $\pi D$

$$\text{Therefore } S = 2\pi R \times 2R = 4\pi R^2, \text{ or } \pi D^2$$

That is, *the surface of a sphere is equal to the square of its diameter multiplied by 3.14159.*

#### THEOREM XVI.

**63.** *The volume of a sphere is the product of its surface by one third of its radius.*

A sphere may be conceived to be composed of an infinite number of pyramids whose vertices are at the centre of the sphere, and whose bases, being infinitely small planes, coincide with the surface of the sphere. The altitude of each of these pyramids is the radius of the sphere, and the sum of the surfaces of their bases is the surface of the sphere. The volume of each pyramid is the product of the area of its base by one third of its altitude, that is, of the radius of the sphere (51); and the volume of all the pyramids, that is, of the sphere, is, therefore, the product of the surface of the sphere by one third of its radius.

**64. Cor. 1.** Let  $V$  = the volume of the sphere, and  $R$ ,  $D$ , and  $S$  the same as in (62). Then, as (62)

$$S = 4\pi R^2, \text{ or } \pi D^2$$

$$V = 4\pi R^2 \times \frac{1}{3}R = \frac{4}{3}\pi R^3, \text{ or } \frac{1}{6}\pi D^3$$

That is, *the volume of a sphere is the cube of the diameter multiplied by .5236.*

**65. Cor. 2.** As in these equations  $\frac{4}{3}\pi$  and  $\frac{1}{6}\pi$  are constant, *the volumes of spheres vary as the cubes of their radii, or as the cubes of their diameters.*

## PRACTICAL QUESTIONS.

1. How many square feet in the convex surface of a right prism whose altitude is 2 feet, and whose base is a regular hexagon of which each side is 8 inches long ? How many square feet in the whole surface ? *8*
2. The radius of the base of a cylinder is 6 inches, and its altitude 3 feet ; how many square feet in the whole surface ? *15.791*
3. What is the number of feet in the bounding planes of a cube whose edge is 5 feet ? The number of solid feet in the cube ? *-125*
4. What is the number of feet in the bounding planes of a right parallelopiped whose three dimensions are 4, 7, and 9 feet ? The number of cubic feet in the parallelopiped ? *-252*
5. What is the number of cubic feet in the right prism whose dimensions are given in the first example ?
6. What is the number of cubic feet in the cylinder whose dimensions are given in the second example ?
7. The altitude of a prism is 9 feet and the perimeter of the base 6 feet. What is the altitude and perimeter of the base of a similar prism one third as great ?
8. What is the ratio of the volumes of two cylinders whose altitudes are as 3 : 6, if the cylinders are similar ? What, if the bases are equal ? What, if the bases are as 3 : 6 and the altitudes equal ?
9. How many square feet in the convex surface of a right pyramid whose slant height is 3 feet, and whose base is a regular octagon of which each side is 2 feet long ?
10. How many square feet in the convex surface of a cone whose slant height is 5 feet and whose base has a radius of 2 feet ? How many square feet in the whole surface ?
11. How many cubic feet in a right quadrangular pyramid whose altitude is 10 feet, and whose base is 3 feet square ?
12. How many cubic feet in the cone whose dimensions are given in the tenth example ?
13. The slant height of a frustum of a right pyramid is 6 feet, and the perimeters of the two bases are 18 feet and 12 feet respectively ; what is the convex surface of the frustum ?
14. What would be the slant height of the pyramid whose frustum is given in the preceding example ?
15. What is the whole surface of a frustum of a cone whose altitude is 8 feet, and of whose bases the radii are 11 feet and 5 feet respectively ?

16. The altitude of a pyramid is 25 feet, and its base is a rectangle 8 feet by 6 ; how many cubic feet in the pyramid ?
17. The altitude of a cone is 20 feet, and the radius of its base 5 feet ; how many cubic feet in the cone ?
18. How many cubic feet in a frustum of the cone given in the preceding example, cut off by a plane 5 feet from the base ?
19. How far from the base must a cone whose altitude is 12 feet be cut off so that the frustum shall be equivalent to one half of the cone ?
20. How many square feet in the surface of a sphere whose radius is 6 feet ?
21. How many cubic feet in a sphere whose radius is 8 feet ?
22. What is the ratio of the volumes of two spheres whose radii are as 4 : 8 ?
23. Are spheres always similar solids ? Are cones ?
24. What is the least number of planes that can enclose a space ?

### EXERCISES.

66. The convex surfaces of right prisms of equal altitudes are as the perimeters of their bases. (14.)
67. The opposite faces of a parallelopiped are equal and parallel.
68. The four diagonals of a parallelopiped bisect each other.
69. A plane passing through the opposite edges of a parallelopiped bisects the parallelopiped.
70. In a rectangular parallelopiped the diagonals are equal ; and the square of each is equal to the sum of the squares of the three dimensions.
71. In a cube the square of a diagonal is three times the square of an edge.
72. Prisms are to each other as the products of their bases by their altitudes. (25.)
73. Prisms with equivalent bases are as their altitudes; with equal altitudes, as their bases. (72.)

**74.** Polygons formed by parallel planes cutting a pyramid are as the squares of their distances from the vertex. (39; II. 31.)

**75.** Pyramids are to each other as the products of their bases by their altitudes. (51.)

**76.** Pyramids with equivalent bases are as their altitudes; with equal altitudes, as their bases. (75.)

**77.** How can Theorem VIII. be proved from Theorem IX.?

**78.** If a pyramid is cut by a plane parallel to its base, the pyramid cut off will be similar to the whole pyramid. (39; 4.)

**79.** In a sphere great circles bisect each other.

**80.** A great circle bisects a sphere. (54.)

**81.** The centre of a small circle is in the perpendicular from the centre of the sphere to the small circle.

**82.** Small circles equally distant from the centre of a sphere are equal.

**83.** The intersection of the surfaces of two spheres is the circumference of a circle.

**84.** The arc of a great circle can be made to pass through any two points on the surface of a sphere. (IV. 4.)

**85.** *Definition.* A plane is tangent to a sphere when it touches but does not cut the sphere.

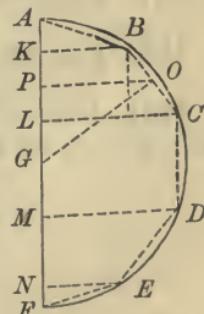

**86.** Prove that the radius of a sphere to the point of tangency of a plane is perpendicular to the plane. (IV. 8.)

**87.** As the semi-decagon revolves about  $A F$ , what kind of a solid is described by the triangle  $A BK$ ? What by the trapezoid  $K C$ ? By  $L D$ ?

**88.** The surface described by the line  $A B = A K \times \text{circ. } GO$ .

Draw from  $G$  a perpendicular to  $A B$ , and from the point where it meets  $A B$  a perpendicular to  $A F$ . (42.)

**89.** The surface described by the line  $C D = L M \times \text{circ. } GO$ . (15.)

**90.** *Definition.* The surfaces described by the arcs  $A B$ ,  $B C$ ,  $CD$ , &c. are called *zones*.

**91.** The area of a zone is equal to the product of its altitude by the circumference of a great circle.

**92.** Zones on the same or equal spheres are as their altitudes.

**93.** The surface of a sphere is four times the surface of one of its great circles. (62; III. 32.)

**94.** *Definition.* A polyedron is circumscribed about a sphere when its faces are each tangents to the sphere. In this case the sphere is inscribed in the polyedron.

**95.** The surface of a sphere is equal to the convex surface of the circumscribed cylinder. (62; 15.)

**96.** *Definition.* A **Spherical Sector** is the solid described by any sector of a semicircle as the semicircle revolves about its diameter.

**97.** The volume of a spherical sector is equal to the product of the surface of the zone forming its base by one third of the radius of the sphere of which it is a part.

**98.** A **Spherical Segment** is a part of a sphere included by two parallel planes cutting or touching the sphere. When one plane touches and one cuts the sphere, the spherical segment is called a *spherical segment of one base*; when both cut, a *spherical segment of two bases*.

**99.** How can the volume of a spherical segment of one base be found? A spherical segment of two bases?

**100.** A sphere is two thirds of the circumscribed cylinder.

**101.** A cone, hemisphere, and cylinder having equal bases and the same altitude are as the numbers 1, 2, 3.

## BOOK VI.

---

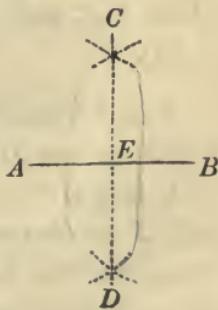

### PROBLEMS OF CONSTRUCTION.

IN the preceding demonstrations we have assumed that our figures were already constructed. The Problems of Construction given in this Book depend for their solution upon the principles of the preceding Books. In some of the problems the construction and demonstration are given in full; in others the construction is given and the propositions necessary to prove the construction referred to in the order in which they are to be used, and the pupil must complete the demonstration. In a few instances references are made to the Exercises appended to the previous Books. In such cases either the propositions to which reference is made can be demonstrated or the problem omitted.

#### PROBLEM I.

##### 1. *To bisect a given straight line.*

Let  $A B$  be the given straight line. From  $A$  and  $B$  as centres with a radius greater than half of  $A B$ , describe arcs cutting one another at  $C$  and  $D$ ; join  $C$  and  $D$  cutting  $A B$  at  $E$ , and the line  $A B$  is bisected at  $E$ . For  $C$  and  $D$  being each equally distant from  $A$  and  $B$ , the line  $C D$  must be perpendicular to  $A B$  at its middle point (converse of I. 53).

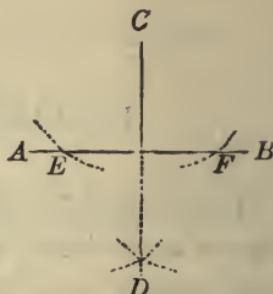

## PROBLEM II.

2. From a given point without a straight line to draw a perpendicular to that line.

Let  $C$  be the point and  $AB$  the line.

From  $C$  as a centre describe an arc cutting  $AB$  in two points  $E$  and  $F$ ; with  $E$  and  $F$  as centres, with a radius greater than half  $EF$ , describe arcs intersecting at  $D$ . Draw  $CD$ , and it is the perpendicular required (converse of I. 53).

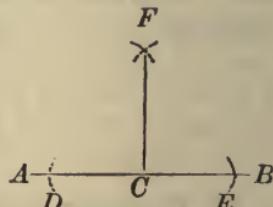

## PROBLEM III.

3. From a given point in a straight line to erect a perpendicular to that line.

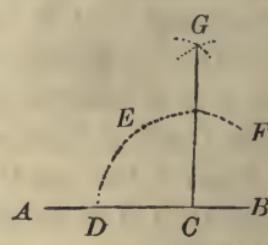

Let  $C$  be the given point and  $AB$  the given line.

With  $C$  as a centre describe an arc cutting  $AB$  in  $D$  and  $E$ ; with  $D$  and  $E$  as centres, with a radius greater than  $DC$ , describe arcs intersecting at  $F$ .

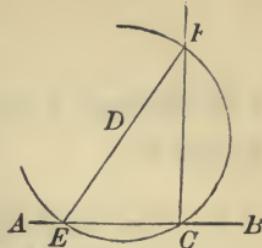

Draw  $CF$ , and it is the perpendicular required (converse of I. 53).

*Second Method.* With  $C$  as a centre describe an arc  $DEF$ ; take the distances  $DE$  and  $EF$  equal to  $CD$ , and from  $E$  and  $F$  as centres, with a radius greater than half the distance from  $E$  to  $F$ , describe arcs intersecting at  $G$ . Draw  $CG$ , and it is the perpendicular required (III. 33; III. 16; III. 15).

*Third Method.* With any point,  $D$ , without the line  $A B$ , with a radius equal to the distance from  $D$  to  $C$ , describe an arc cutting  $A B$  at  $E$ ; draw the diameter  $E D F$ . Draw  $C F$ , and it is the perpendicular required (III. 23).

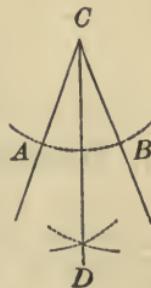

## PROBLEM IV.

4. *To bisect a given arc, or angle.*

1st. Let  $A B$  be the given arc. Draw the chord  $A B$  and bisect it with a perpendicular (1; III. 16).

2d. Let  $C$  be the given angle.

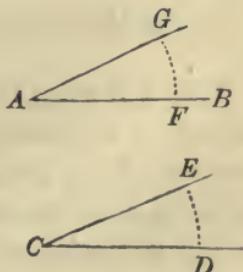

With  $C$  as a centre describe an arc cutting the sides of the angle in  $A$  and  $B$ ; bisect the arc  $A B$  with the line  $C D$ , and it will also bisect the angle  $C$  (III. 11).

## PROBLEM V.

5. *At a given point in a straight line to make an angle equal to a given angle.*

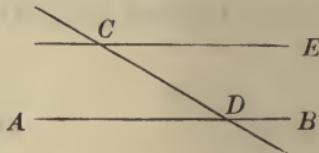

Let  $A$  be the given point in the line  $A B$ , and  $C$  the given angle. With  $C$  as a centre describe an arc  $D E$  cutting the sides of the angle  $C$ ; with  $A$  as a centre, with the same radius, describe an arc; with  $F$  as a centre, with a radius equal to the distance from  $D$  to  $E$ , describe an arc cutting the arc  $FG$ . Draw  $A G$ . The angle  $A = C$  (III. 12; III. 11).

## PROBLEM VI.

- 6.** Through a given point to draw a line parallel to a given straight line.

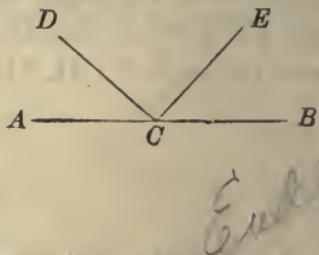

Let  $C$  be the given point, and  $AB$  the given line. From  $C$  draw a line  $CD$  to  $AB$ ; at  $C$  in the line  $DC$  make an angle  $DCE$  equal to  $CDA$  (5);  $CE$  is parallel to  $AB$  (I. 18).

## PROBLEM VII.

- 7.** Two angles of a triangle given, to find the third.

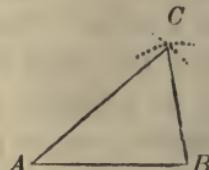

Draw an indefinite line  $AB$ ; at any point  $C$  make an angle  $ACD$  equal to one of the given angles, and  $DCE$  equal to the other (5). Then  $ECB$  is the third angle (I. 7; I. 33).

## PROBLEM VIII.

- 8.** The three sides of a triangle given, to construct the triangle.

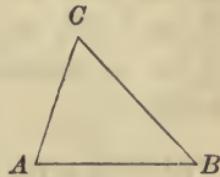

Take  $AB$  equal to one of the given sides; with  $A$  as a centre, with a radius equal to another of the given sides, describe an arc, and with  $B$  as a centre, with a radius equal to the remaining side, describe an arc intersecting the first arc at  $C$ . Draw  $AC$  and  $CB$ , and  $ACB$  is evidently the triangle required.

## PROBLEM IX.

*9. Two sides and the included angle of a triangle given, to construct the triangle.*

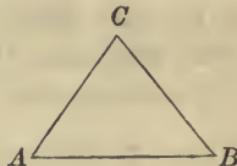

Draw  $A B$  equal to one of the given sides; at  $B$  make the angle  $A B C$  equal to the given angle (5), and take  $B C$  equal to the other given side; join  $A$  and  $C$ , and  $A B C$  is evidently the triangle required.

## PROBLEM X.

*10. Two angles and a side of a triangle given, to construct the triangle.*

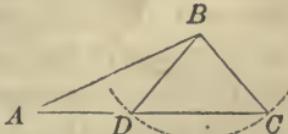

If the angles given are not both adjacent to the given side, find the third angle by (7). Then draw  $A B$  equal to the given side, and at  $B$  make an angle  $A B C$  equal to one of the angles adjacent to  $A B$ , and at  $A$  make an angle  $B A C$  equal to the other angle adjacent to  $A B$ , and  $A B C$  is evidently the triangle required.

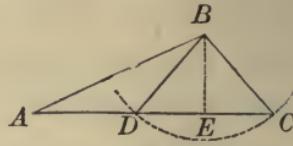

## PROBLEM XI.

*11. Two sides of a triangle and the angle opposite one of them given, to construct the triangle.*

Draw an indefinite line  $A C$ ; at  $A$  make the angle  $C A B$  equal to the given angle, and take  $A B$  equal to the side adjacent to the given angle; with  $B$  as a centre, with a radius equal to the other given side, describe an arc cutting  $A C$ . If the given angle  $A$  is acute,

1st. The given side  $BC$ , opposite the given angle, may be less than the other given side; then the arc described from  $B$  as a centre will cut  $AC$  in two points,  $C$  and  $D$ , on the same side of  $A$ , and, drawing  $BC$  and  $BD$ , the triangles  $ABC$  and  $ABD$  (whose angle  $BDA$  is the supplement of the angle  $BCA$ ), both satisfy the given conditions.

2d. The given side opposite the given angle may be equal to the perpendicular  $BE$ ; then the arc described from  $B$  as a centre will touch  $AC$ , and the right triangle  $ABE$  is the only one that can satisfy the given conditions.

3d. The side opposite the given angle may be greater than the other given side; then the arc described from  $B$  as a centre will cut  $AC$  in  $C$ , and in another point on the other side of  $A$ . In this case there can be but one triangle  $ABC$  satisfying the given conditions, the triangle formed on the opposite side of  $AB$  containing not the given angle but its supplement.

4th. If the given angle is not acute, the given side opposite the given angle must be greater than the other given side, and, as in the last case above, there can be but one solution.

**12. Scholium.** If the side opposite the given angle  $A$  is less than the perpendicular, or if the given angle is not acute, and at the same time the side opposite the given angle is less than the other given side, the solution is impossible.

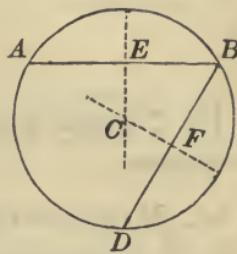

**13. Corollary.** From this and the preceding Problem and Theorems VIII., IX., and XIV. of Book I., it follows that with the exception of the ambiguity pointed out in the first part of this Problem, two triangles are equal if any three parts, of which one is a side, of the one are equal to the corresponding parts of the other.

## PROBLEM XII.

**14.** To find the centre of a given circumference or of a given arc.

Let  $A B D$  be the given circumference, or arc.

Draw any two chords not parallel to each other, as  $A B, B D$ , and bisect these chords by the perpendiculars  $C E$  and  $C F$ . These perpendiculars will intersect at the centre of the circumference or arc (III. 17).

**15. Scholium.** By the same construction a circumference may be made to pass through any three given points; or a circle circumscribed about a given triangle; or about a given regular polygon (II. 34).

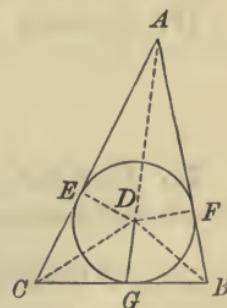

## PROBLEM XIII.

**16.** To inscribe a circle in a given triangle.

Let  $A B C$  be the given triangle.

Bisect any two of its angles, as  $A$  and  $C$ . With the point  $D$ , where the two bisecting lines meet, as a centre, with a radius equal to the distance of  $D$  from any one of the sides, describe a circle, and it will be the circle required.

Draw the perpendicular  $D E, D F, D G$ . The angles at  $A$  are equal by construction, and the angles  $A E D$  and  $A F D$  are each right angles; therefore the triangles  $A D E$  and  $A F D$  are mutually equiangular (I. 35), and the hypotenuse  $A D$  is common; therefore the triangles are equal (I. 41), and  $D E = D F$ . In like manner  $D E = D G$ . Therefore the circle described from  $D$  as a centre with the radius  $D E$  will pass through the points  $F$  and  $G$ ; and since the angles at  $E, F, G$  are right angles, the sides of the triangle  $A B C$  are

tangents ; therefore the circle  $EFG$  is inscribed in the triangle  $ABC$  (III. 20).

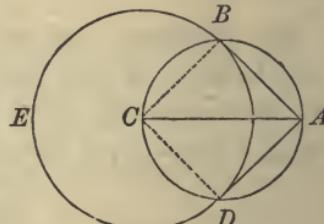

**17. Scholium.** The lines bisecting the angles of a triangle all meet in the same point.

#### PROBLEM XIV.

**18. Through a given point to draw a tangent to a given circumference.**

- 1st. If the given point is in the circumference.  
Erect a perpendicular to the radius at the given point (III. 47).
- 2d. If the given point is without  
the circumference.

Join the given point  $A$  with the centre  $C$  of the given circle  $BDE$  ; on  $AC$  as a diameter describe a circle cutting the given circle in  $B$  and  $D$ . Draw  $AB$  and  $AD$ , and each will be tangent to the given circle through the given point. For drawing the radii  $CB, CD$ , the angles  $B, D$  are each right angles (III. 23) ; therefore  $AB, AD$  are tangents to the given circle.

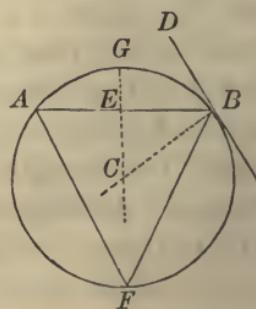

**19. Corollary.** The tangents  $AB, AD$  are equal (I. 50).

#### PROBLEM XV.

**20. Upon a given straight line to describe a segment of a circle which shall contain a given angle.**

Let  $AB$  be the given straight line.

At  $B$  make the angle  $ABD$  equal to the given angle (5). Draw  $BC$  perpendicular to  $DB$ ; bisect  $AB$  in  $E$ , and from  $E$  draw  $EC$  perpendicular to  $AB$ . From  $C$ , the point of intersection of  $BC$  and  $EC$ , with a radius equal to  $CB$ , describe a circle  $AGBF$ ;  $BFA$  is the segment required.

$A B$  is a chord (I. 53). And as  $B D$  is perpendicular to the radius  $C B$  at  $B$ ,  $B D$  is a tangent to the circle, and hence the angle  $A B D$  is measured by half the arc  $A G B$  (III. 54); and any angle  $B F A$  inscribed in the segment  $B F A$  is also measured by half the arc  $A G B$  (III. 21), and is therefore equal to the angle  $A B D$  or the given angle.

**21. Corollary.** If the given angle is a right angle, the required segment would be a semicircle described on the given line as a diameter.

### PROBLEM XVI.

**22. To divide a given line into parts proportional to given lines.**

Let it be required to divide  $A B$  into parts proportional to  $M, N, O$ .

Draw at any angle with  $A B$  an indefinite line  $A C$ .

From  $A$  cut off  $A D, D E, E F$  equal respectively to  $M, N, O$ . Join  $B$  to  $F$ , and through  $D$  and  $E$  draw lines parallel to  $B F$ . These parallels divide the line as required (II. 16).

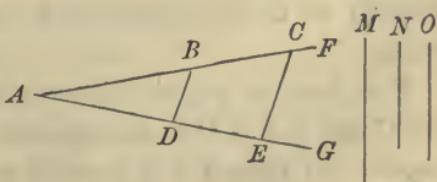

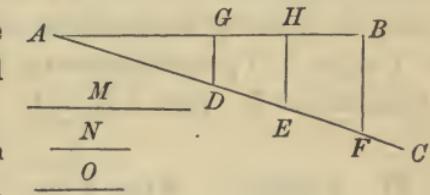

**23. Corollary.** By taking  $M, N, O$  equal, the given line can be divided into equal parts.

### PROBLEM XVII.

**24. To find a fourth proportional to three given lines.**

Let it be required to find a fourth proportional to  $M, N, O$ .

Draw at any angle with each other the indefinite lines  $A F, A G$ . From  $A F$  cut off  $AB = M$ ,  $BC = N$ , and

from  $AG$  cut off  $AD = O$ . Join  $BD$  and through  $C$  draw  $CE$  parallel to  $BD$ ; then  $DE$  is the required fourth proportional (II. 16).

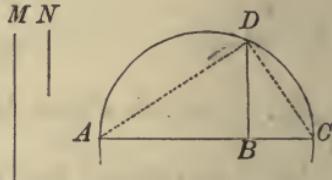

**25. Corollary.** By taking  $AB$  equal to  $M$ , and  $AD$  and  $BC$  each equal to  $N$ , a third proportional can be found to  $M$  and  $N$ .

### PROBLEM XVIII.

**26. To find a mean proportional between two given lines.**

Let it be required to find a mean proportional between  $M$  and  $N$ .

From an indefinite line cut off  $AB = M$ ,  $BC = N$ ; on  $AC$  as a diameter describe a semicircle, and at  $B$  draw  $BD$  perpendicular to  $AC$ .  $BD$  is the mean proportional required. Join  $AD$ ,  $DC$ . (III. 23; II. 26.)

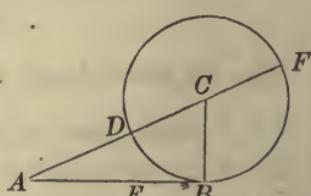

**27. Definition.** When a line is divided so that one segment is a mean proportional between the whole line and the other segment, it is said to be divided *in extreme and mean ratio*.

### PROBLEM XIX.

**28. To divide a given line in extreme and mean ratio.**

Let it be required to divide  $AB$  in extreme and mean ratio.

At  $B$  draw the perpendicular  $BC = \frac{1}{2} AB$ ; join  $AC$ ; cut off  $CD = CB$ ,  $AE = AD$ , and  $AB$  is divided at  $E$  in extreme and mean ratio.

For, describe a circle with the centre  $C$  and radius  $CB$  and produce  $AC$  to meet the circumference in  $F$ ; then  $AF$  is a secant and  $AB$  a tangent of the circle  $DFB$ , and therefore (III. 64)

$$AF : AB = AB : AD$$

and (Pn. 18)

$$AF - AB : AB = AB - AD : AD$$

But

$$AB = 2\ CB = DF$$

therefore

$$AF - AB = AF - DF = AD = AE$$

and the proportion becomes

$$AE : AB = EB : AE$$

or (Pn. 16)

$$AB : AE = AE : EB$$

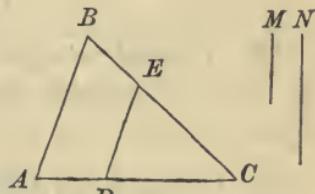

### PROBLEM XX.

**29.** Through a given point within the sides of a given angle to draw a line so that the segments included between the point and the sides of the angle may be in a given ratio.

Let it be required to draw through the point  $D$  within the angle  $B$  a line so that  $AD : DC = M : N$ .

Draw  $DE$  parallel to  $AB$ .

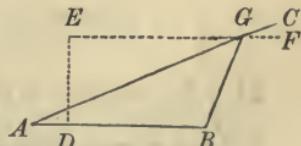

Find  $EC$  a fourth proportional to  $M$ ,  $N$ , and  $BE$  (24); join  $C$  to  $D$ , and produce  $CD$  to  $A$ , and  $AC$  is the line required (II. 16).

### PROBLEM XXI.

**30.** The base, an adjacent angle, and the altitude of a triangle given, to construct the triangle.

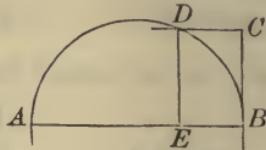

At  $A$  of the base  $AB$  draw an indefinite line  $AC$  making the angle  $A$  equal to the given angle; at any point in  $AB$ , as  $D$ , draw the perpendicular  $DE$  equal to the given altitude; through  $E$  draw  $EF$  parallel to  $AB$  cutting  $AC$  in  $G$ ; join  $GB$ , and  $AGB$  is the triangle required.

## PROBLEM XXII.

- 31.** To construct a parallelogram, having the sum of its base and altitude given, which shall be equivalent to a given square.

On  $A B$ , the given sum, as a diameter, describe a semicircumference. At any point, as  $B$ , in  $A B$  draw the perpendicular  $B C$  equal to a side of the given square; through  $C$  draw  $C D$  parallel to  $A B$ , cutting the circumference in  $D$ ; draw  $D E$  perpendicular to  $A B$ .  $A E, E B$  are one the base and the other the altitude of the parallelogram required (26).

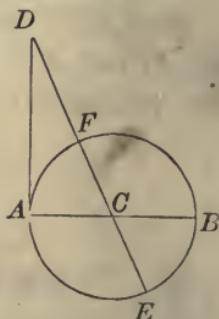

- 32. Scholium.** If the side of the square is greater than half the sum of the base and altitude, the construction is impossible.

## PROBLEM XXIII.

- 33.** To construct a parallelogram having the difference between its base and altitude given, which shall be equivalent to a given square.

On  $A B$  the given difference, as a diameter, describe a circumference. At  $A$  draw the perpendicular  $A D$  equal to a side of the given square; join  $D$  with the centre  $C$ , and produce  $D C$  to  $E$ .  $D F, D E$  are one the base and the other the altitude of the parallelogram required (III. 64).

## PROBLEM XXIV.

- 34.** To construct a square equivalent to a given parallelogram.

Find a mean proportional between the altitude and base of the given parallelogram (26), and it will be a side of the required square.

## PROBLEM XXV.

**35.** *To construct a square equivalent to a given triangle.*

Find a mean proportional between the base and half the altitude (26), and it will be a side of the required square.

## PROBLEM XXVI.

**36.** *To construct a square equivalent to a given circle.*

Find a mean proportional between the radius and the semi-circumference, and it will be a side of the required square.

## PROBLEM XXVII.

**37.** *To construct a square equivalent to the sum of two given squares.*

Construct a right triangle (9) with the sides adjacent to the right angle equal respectively to the sides of the given squares ; the hypotenuse will be a side of the required square (II. 27).

**38.** *Scholium.* By continuing the same process we can find a square equivalent to the sum of any number of given squares.

## PROBLEM XXVIII.

**39.** *To construct a square equivalent to the difference of two given squares.*

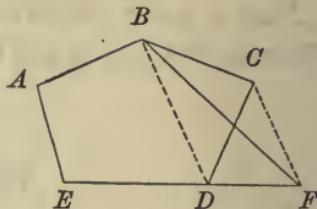

Construct a right triangle (11), taking as the hypotenuse a side of the greater square, and for one of the sides adjacent to the right angle a side of the other square ; the third side of the triangle will be a side of the required square (II. 28).

## PROBLEM XXIX.

**40.** To construct a triangle equivalent to a given polygon.

Let  $A D$  be the polygon.

Draw  $B D$  cutting off the triangle  $B C D$ ; through  $C$  draw  $C F$  parallel to  $B D$  meeting  $E D$  produced in  $F$ ; join  $B F$ , and a polygon  $A B F E$  is formed with one side less than the given polygon and equivalent to it.

For the triangles  $B C D$  and  $B F D$ , having the same base  $B D$ , and the same altitude, are equivalent; adding to each the common part  $A B D E$ , we have  $A B C D E$  equivalent to  $A B F E$ . In like manner a polygon with one side less can be found equivalent to  $A B F E$ , and by continuing the process the sides may be reduced to three, and a triangle obtained equivalent to the given polygon.

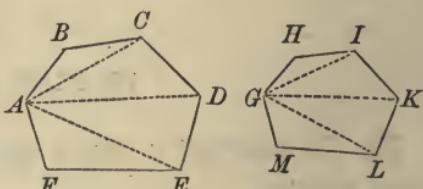

**41. Scholium.** Since by (35) a square can be found equivalent to a given triangle, by (40) and (35) a square can be found equivalent to any polygon.

## PROBLEM XXX.

**42.** On a given line to construct a polygon similar to a given polygon.

Let  $A D$  be the given polygon and  $M L$  the given line.

Draw the diagonals  $A E$ ,  $A D$ ,  $A C$ . At  $M$  and  $L$  make the angles  $G M L$  and

$G L M$  equal respectively to  $A F E$  and  $A E F$ , and a triangle  $G L M$  will be formed similar to  $A E F$ . In like manner on  $G L$  construct a triangle similar to  $A D E$ ; on  $G K$  one similar to  $A C D$ ; on  $G I$  one similar to  $A B C$ ; and the polygons  $A D$ ,

$KG$ , being composed of the same number of similar triangles similarly situated, are similar (II. 75).

## PROBLEM XXXI.

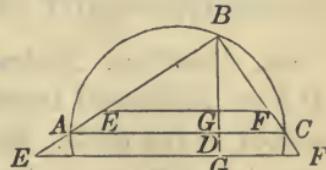

43. *Two similar polygons being given, to construct a similar polygon equivalent to their sum, or to their difference.*

Find a line whose square shall be equivalent to the sum (37), or to the difference (39), of the squares of any two homologous sides of the given polygons, and this will be the homologous side of the required polygon (II. 31). On this line construct (42) a polygon similar to the given polygons.

## PROBLEM XXXII.

44. *To construct a square which shall be to a given square in a given ratio.*

On any line  $AC$ , as a diameter, describe a semicircumference  $ABC$ ; divide the line  $AC$  at the point  $D$  so that  $AD : DC$  in the given ratio. Perpendicular to  $AC$  draw  $DB$  meeting the circumference at  $B$ ; join  $BA, BC$ , and on  $BC$ , produced if necessary, take  $BF =$  a side of the given square. Through  $F$  draw  $EF$  parallel to  $AC$ , meeting  $BA$  in  $E$ , and  $BE$  is a side of the required square.

For as  $B$  is a right angle (III. 23), we have (II. 72)

$$BE^2 : BF^2 = EG : GF$$

But as  $EF$  is parallel to  $AC$ , we have (II. 47)

$$EG : GF = AD : DC$$

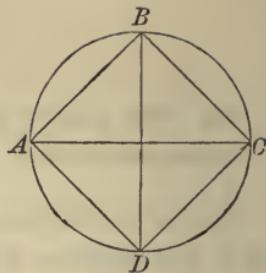

therefore (Pn. 11)

$$BE^2 : BF^2 = AD : DC$$

## PROBLEM XXXIII.

**45.** *To inscribe a square in a given circle.*

Draw two diameters  $A C, B D$  at right angles to each other, and join  $A B, B C, C D, D A$ ;  $A B C D$  is the required square (III. 23; III. 12).

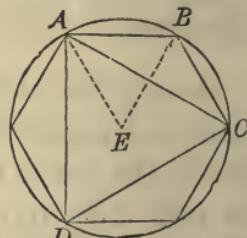

**46. Corollary.** By bisecting the arcs  $A B, B C, C D, D A$ , and drawing the chords of these smaller arcs, a regular octagon will be inscribed in the circle. By continuing this bisection regular polygons can be inscribed having the number of their sides 16, 32, 64, and so on.

## PROBLEM XXXIV.

**47.** *To inscribe a regular hexagon in a given circle.*

Take  $A B$  equal to the radius of the given circle, and it will be a side of the hexagon required (III. 33).

**48. Corollary.** By drawing  $A C, C D, D A$  an equilateral triangle will be inscribed in the circle. By bisecting the arcs  $A B, B C, \&c.$ , and continuing this bisection as in (46), and drawing the chords of these smaller arcs, regular polygons can be inscribed having the number of their sides 12, 24, 48, 96, and so on.

## PROBLEM XXXV.

**49.** *To inscribe a regular decagon in a given circle.*

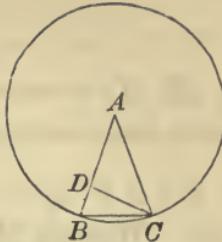

Divide the radius  $A B$  in extreme and mean ratio at the point  $D$  (28), and take  $B C = A D$ , the greater segment, and it will be the side of the required decagon.

Draw  $AC$ ,  $CD$ . The triangles  $ACB$ ,  $DCB$  are similar (II. 23); for they have the angle  $B$  common, and by construction

$$AB : AD = AD : DB$$

but  $AD = BC$

therefore  $AB : BC = BC : BD$

Therefore, as  $ACB$  is isosceles,  $DCB$  is also isosceles, and  $CD = CB$ ; therefore also  $CD = DA$ , and  $ACD$  is an isosceles triangle, and the angle  $A = ACD$ . But the exterior angle  $BDC = A + ACD =$  twice the angle  $A$ . Therefore, as  $B = BDC$ ,  $B =$  twice the angle  $A$ . But  $B = ACB$ ; therefore the sum of the three angles  $A$ ,  $B$ , and  $ACB$  is equal to five times the angle  $A$ ; or the angle  $A$  is one fifth of two right angles, or one tenth of four right angles; therefore the arc  $BC$  is one tenth of the circumference, and the chord  $BC$  a side of a regular decagon inscribed in the circle.

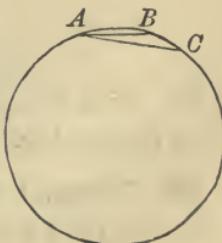

**50. Corollary.** By drawing chords joining the alternate vertices a regular pentagon will be inscribed. By proceeding as in (46) regular polygons can be inscribed having the number of their sides 20, 40, 80, and so on.

#### PROBLEM XXXVI.

**51. To inscribe a regular polygon of fifteen sides in a given circle.**

Find by (47) the arc  $AC$  equal to a sixth of the circumference, and by (49) the arc  $AB$  equal to a tenth of the circumference, and the chord  $BC$  will be a side of the polygon required.

For  $\frac{1}{6} - \frac{1}{10} = \frac{1}{30}$

**52. Corollary.** Proceeding as in (46) regular polygons can be inscribed having the number of their sides 30, 60, and so on.

## PROBLEM XXXVII.

**53.** To circumscribe about a given circle a polygon similar to a given inscribed regular polygon.

Let  $AD$  be the given inscribed polygon. Through the points  $A, B, C, D, E, F$  draw tangents to the circumference. These tangents intersecting will form the polygon required.

For the triangles  $AGB, BHC, \text{ &c.}$  are isosceles (19); and as the arcs  $AB, BC, \text{ &c.}$  are equal, the angles  $GAB, GBA, HBC, HCB, \text{ &c.}$  are equal (III. 54); therefore, as the bases  $AB, BC, \text{ &c.}$  are equal, these isosceles triangles are equal. Hence the angles  $G, H, I, K, L, M$  are equal, and the polygon  $MI$  is equiangular; and as  $GB = BH = HC = CI, \text{ &c.}, GH = HI, \text{ &c.};$  therefore the polygon  $MI$  is equilateral and regular (II. 32). It is also similar to  $AD$  (II. 33); and as its sides are tangents it is circumscribed about the circle.

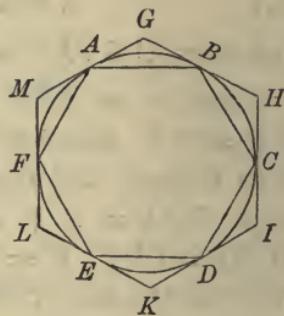

**54. Corollary.** As (45–52) regular polygons can be inscribed having the number of their sides 3, 4, 5, 6, 8, 10, 12, 15, 16, 20, 24, 30, 32, 40, 48, 60, 64, 80, 96, and so on, regular polygons having the number of their sides represented by these numbers can also be circumscribed about a given circle.

## EXERCISES.

**55.** From two given points to draw two equal lines meeting in a given straight line. (I. 53.)

**56.** Through a given point to draw a line at equal distances from two other given points.

**57.** From a given point out of a straight line to draw a line making a given angle with that line. (I. 17.)

**58.** From two given points on the same side of a given line to draw two lines meeting in the first line and making equal angles with it.

**59.** From a given point to draw a line making equal angles with the sides of a given angle.

**60.** Through a given point to draw a line so that the parts of the line intercepted between this point and perpendiculars from two other given points shall be equal.

If the three points are in a straight line, the parts equal what?

**61.** From a point without two given lines to draw a line such that the part between the two lines shall be equal to the part between the given point and the nearer line.

When is the Problem impossible?

**62.** To trisect a right angle.

**63.** On a given base to construct an isosceles triangle having each of the angles at the base double the third angle.

**64.** To construct an isosceles triangle when there are given

1st. The base and opposite angle.

2d. The base and an adjacent angle.

3d. A side and an opposite angle.

4th. A side and the angle opposite the base.

**65.** The base, opposite angle, and the altitude given, to construct the triangle. (III. 22.) (20.)

When is the Problem impossible?

**66.** The base, an angle at the base, and the sum of the sides given, to construct the triangle.

When is the Problem impossible?

**67.** The base, an angle at the base, and the difference of the sides given, to construct the triangle.

1st. When the given angle is adjacent to the shorter side.

2d. When the given angle is adjacent to the longer side.

When is the Problem impossible?

**68.** The base, the difference of the sides, and the difference of the angles at the base given, to construct the triangle.

**69.** The base, the angle at the vertex, and the sum of the sides given, to construct the triangle.

When is the Problem impossible?

**70.** The base, the angle at the vertex, and the difference of the sides given, to construct the triangle.

**71.** On a given base to construct a triangle equivalent to a given triangle.

**72.** With a given altitude to construct a triangle equivalent to a given triangle.

**73.** Two sides of a triangle and the perpendicular to one of them from the opposite vertex given, to construct the triangle.

**74.** Two of the perpendiculars from the vertices to the opposite sides and a side given, to construct the triangle.

1st. When one of the perpendiculars falls on the given side.

2d. When neither of the perpendiculars falls on the given side.

**75.** An angle and two of the perpendiculars from the vertices to the opposite sides given, to construct the triangle.

1st. When one of the perpendiculars falls from the vertex of the given angle.

2d. When neither of the perpendiculars falls from the vertex of the given angle.

**76.** An angle and the segments of the opposite side made by a perpendicular from the vertex given, to construct the triangle.

 **77.** Given an angle, the opposite side, and the line from the given vertex to the middle of the given side, to construct the triangle.

When is the Problem impossible ?

**78.** An angle, a perpendicular from another angle to the opposite side, and the radius of the circumscribed circle given, to construct the triangle.

When is the Problem impossible ?

**79.** To divide a triangle into two parts in a given ratio,

1st. By a line drawn from a given point in one of its sides.

2d. By a line parallel to the base.

*maths money*

80. To trisect a triangle by straight lines drawn from a point within to the vertices.

81. Parallel to the base of a triangle to draw a line equal to the sum of the lower segments of the two sides.

82. Parallel to the base of a triangle to draw a line equal to the difference of the lower segments of the two sides.

83. To inscribe in a given triangle a quadrilateral similar to a given quadrilateral.

84. To divide a given line so that the sum of the squares of the parts shall be equivalent to a given square.

85. To construct a parallelogram when there are given,

- 1st. Two adjacent sides and a diagonal.
- 2d. A side and two diagonals.
- 3d. The two diagonals and the angle between them.
- 4th. The perimeter, a side, and an angle.

86. To construct a square when the diagonal is given.

87. To construct a parallelogram equivalent to a given triangle and having a given angle.

88. To draw a quadrilateral, the order and magnitude of all the sides and one angle given.

Show that sometimes there may be two different polygons satisfying the conditions.

89. To draw a quadrilateral, the order and magnitude of three sides and two angles given.

- 1st. The given angles included by the given sides.
  - 2d. The two angles adjacent, and one adjacent to the unknown side.
  - 3d. The two angles being opposite each other.
  - 4th. The two angles being both adjacent to the unknown side.
- In any of these cases can more than one quadrilateral be drawn?

90. To draw a quadrilateral, the order and magnitude of two sides and three angles given.

- 1st. The given sides being adjacent.
- 2d. The given sides not being adjacent.

**91.** In a given circle to inscribe a triangle similar to a given triangle.

**92.** Through a given point to draw to a given circle a secant such that the part within the circle may be equal to a given line.

**93.** With a given radius to draw a circumference,

- 1st. Through two given points.
- 2d. Through a given point and tangent to a given line.
- 3d. Through a given point and tangent to a given circumference.
- 4th. Tangent to two given straight lines.
- 5th. Tangent to a given straight line and to a given circumference.
- 6th. Tangent to two given circumferences.

State in each of these cases how many circles can be drawn, and when the construction is impossible.

**94.** To draw a circumference,

- 1st. Through two given points and with its centre in a given line.
- 2d. Through a given point and tangent to a given line at a given point.
- 3d. Tangent to a given line at a given point, and also tangent to a second given line.
- 4th. Tangent to three given lines.
- 5th. Through two given points and tangent to a given line.
- 6th. Through a given point and tangent to two given lines.

**95.** To draw a tangent to two circumferences.

There can be drawn,

- 1st. When the circles are external to each other, four tangents.
- 2d. When the circles touch externally, three.
- 3d. When the circles cut, two.
- 4th. When the circles touch internally, one.
- 5th. When one circle is within the other, none.

# PLANE TRIGONOMETRY.

## CHAPTER I.

### PRELIMINARY.

#### LOGARITHMS.

*June 2nd 1878*  
1. Logarithms are exponents of the powers of some number which is taken as a base. In the tables of Logarithms in common use, the number 10 is taken as the base, and all numbers are considered as powers of 10.

And, since

$$10^0 = 1, \text{ that is, since the Logarithm of } 1 \text{ is } 0,$$

$$10^1 = 10, \quad " \quad " \quad " \quad 10 \text{ " } 1,$$

$$10^2 = 100, \quad " \quad " \quad " \quad 100 \text{ " } 2,$$

$$10^3 = 1000, \quad " \quad " \quad " \quad 1000 \text{ " } 3,$$

$$\text{ &c.,} \quad \text{ &c.,} \quad \text{ &c.,}$$

the Logarithm of any number between 1 and 10 is between 0 and 1, that is, is a fraction; the Logarithm of any number between 10 and 100 is between 1 and 2, that is, is 1 plus a fraction; and the Logarithm of any number between 100 and 1000 is 2 plus a fraction; and so on.

And, as

$$10^{-1} = 0.1, \text{ that is, since the Logarithm of } 0.1 \text{ is } -1,$$

$$10^{-2} = 0.01, \quad " \quad " \quad " \quad 0.01 \text{ " } -2,$$

$$10^{-3} = 0.001, \quad " \quad " \quad " \quad 0.001 \text{ " } -3,$$

$$\text{ &c.,} \quad \text{ &c.,} \quad \text{ &c.,}$$

the Logarithm of any number between 1 and 0.1 is between 0 and  $-1$ , that is, is  $-1$  plus a fraction; the Logarithm of any

number between 0.1 and 0.01 is between —1 and —2, that is, is —2 plus a fraction; and so on. The Logarithms of most numbers, therefore, consist of an integer, either positive or negative, and a fraction, which is always positive. The representation of the Logarithms of all numbers less than a unit by a *negative integer* and a *positive fraction* is merely a matter of convenience.

**2.** The integral part of a Logarithm is called the *characteristic*, and is not generally written in the tables, but can be found by the following

#### RULE.

*The characteristic of the Logarithm of any number is equal to the number of places by which its first significant figure on the left is removed from units' place, the characteristic being positive when this figure is to the left and negative when it is to the right of units' place.*

E. g. The Logarithm of 59 is 1 plus a fraction; that is, the characteristic of the Logarithm of 59 is 1. The Logarithm of 5417.7 is 3 plus a fraction; that is, the characteristic of the Logarithm of 5417.7 is 3. The Logarithm of 0.3 is —1 plus a fraction; that is, the characteristic of the Logarithm of 0.3 is —1. The Logarithm of 0.00017 is —4 plus a fraction; that is, the characteristic of the Logarithm of 0.00017 is —4.

**3.** Since the base of this system of Logarithms is 10, if any number is multiplied by 10, its Logarithm will be increased by a unit; if divided by 10, diminished by a unit.

That is, the Log. of 5547	being	3.744058,
“ “ 554.7	is	2.744058,
“ “ 55.47	“	1.744058,
“ “ 5.547	“	0.744058,
“ “ .5547	“	1.744058,
“ “ .05547	“	2.744058,
“ “ .005547	“	3.744058.

*Hence, the decimal part of the Logarithm of any set of figures is the same, wherever the decimal point may be.*

The minus sign is written over the characteristic, as only the characteristic is negative.

### TABLE OF LOGARITHMS.

**4.** In the tables of Logarithms, generally, the decimal only is given, and the characteristic must be supplied, according to the Rule in Art. 2.

**5.** *To find the Logarithm of any number of three or less figures.*

Find the given number in the column marked N., and directly opposite, in the column marked 0, is the decimal part of the Logarithm, to which must be prefixed the characteristic, according to the Rule in Art. 2.

E. g.	The Log. of 832 is 2.920123
	“ “ 108 “ 2.033424

The first two figures of the decimal, remaining the same for several successive numbers, are not repeated, but are left to be supplied. Thus the Log. of 839 is 2.923762.

As, according to Art. 3, multiplying a number by 10 increases its Logarithm by a unit, therefore, to find the Logarithm of any number containing only three significant figures with one or more ciphers annexed, we use the same rule as in the last case.

E. g.	The Log. of 8320 is 3.920123
	“ “ 756000 “ 5.878522

The Logarithms of the integral numbers from 1 to 100 inclusive are given with the characteristic on the first page of the tables.

**6. To find the Logarithm of any number consisting of four figures.**

Look for the first three figures in the column marked N., and for the fourth figure at the top of one of the columns. Opposite the first three figures, and in the column under the fourth figure, will be the last four figures of the decimal part of the Logarithm, to which the first two figures in the column marked 0 are to be prefixed, and the characteristic, according to the Rule in Art. 2. As shown in Art. 3, moving the decimal point of a number to the right increases, to the left decreases, the characteristic as many units as the number of places the point is moved. In some of the columns marked 1, 2, 3, &c., dots will be found. This shows that the two figures which are to be prefixed from the column marked 0 have changed to the next larger number, and are to be found in the horizontal line directly below. The dots are used to avoid any mistake, and their place is to be supplied with ciphers.

E. g.	The Log. of	2951	is	3.469969
	"	5496	"	3.740047
	"	768700	"	5.885757

**7. To find the Logarithm of any number consisting of more than four figures.**

Find the Logarithm of the first four figures as before ; multiply by the remaining figures the number standing opposite, in the column marked D., reject from the right as many figures as you multiply by, and add what is left to the Logarithm previously found.

E. g. Required, the Log. of 609946.

The Log. of 609900 is	5.785259
-----------------------	----------

Under D. opposite is 71, which multiplied by 46 gives	32.66
---	-------

Therefore, the Log. of 609946 is	<hr/> 5.785292 *
----------------------------------	------------------

\* Whenever the fractional part omitted is larger than half the unit in the next place to the left, one is added to that figure.

Required, the Log. of 84997.

Log. of 84990 is	4.929368
Under D. opposite is 51, which multiplied by 7 gives	35.7
Therefore, Log. of 84997 is	4.929404

The column marked D. contains the average difference of the ten Logarithms against which it stands. The reason for rejecting from the product as many figures as you multiply by is, that these figures are just so many places farther to the right than the figures whose Logarithm has already been found.

This method of finding the Logarithms of large numbers supposes that the Logarithms vary as the numbers, which is not strictly true, though sufficiently so to allow the use of this method in ordinary calculations.

If the number whose Logarithm is sought contains decimal figures, the decimal part of the Logarithm, according to Art. 3, is the same as though there were no decimal point; but the characteristic varies according to the Rule in Art. 2.

The Logarithm of a vulgar fraction may best be found by reducing the fraction to a decimal, and then proceeding as above.

#### 8. To find the Natural Number corresponding to a given Logarithm.

Neglecting the characteristic, find, if possible, in the table the Logarithm given. The three figures opposite in the column N., with the number at the head of the column in which the Logarithm is found, affixed, and the decimal point so placed as to make the number of integral figures correspond to the characteristic of the given Logarithm, as taught in Art. 2, will be the number required.

E. g. The Natural Number corresponding to Log. 5.531862 is 340300.

The Natural Number corresponding to Log. 1.605951 is 40.36.

If the decimal part of the Logarithm cannot be exactly

found, take the Natural Number corresponding to the next less Logarithm, as before ; then find the difference between this and the given Logarithm ; divide this difference by the tabular difference in the column opposite, under D., annexing to the dividend *one* cipher to get the *first figure* of the quotient, and *affix* this quotient to the number already found.

E. g. Required, the Natural Number corresponding to Log. 2.763598

Next less Log., 2.763578, and number corresponding, 580.2

Divide by { number in col. D., opp.} 75)	20.0(267	267
--	----------	-----

Number required, 580.2267

The number corresponding to Log. 4.816601 will, in the same way, be found to be .000655542.

#### EXAMPLES.

1. Find the Log. of 3764.
2. Find the Log. of 2576000.
3. Find the Log. of 7.546.
4. Find the Log. of 0.0017.
5. Find the Log. of  $\frac{4}{17}$ .
6. Find the Natural Number to Log. 3.807873.
7. Find the Natural Number to Log. 1.820004.
8. Find the Natural Number to Log. 2.982197.
9. Find the Natural Number to Log. 2.910037.
10. Find the Natural Number to Log. 4.850054.

- 9.** The great utility of Logarithms in arithmetical operations consists in this, that addition takes the place of multiplication, and subtraction of division, multiplication of involution, and division of evolution. That is, to multiply numbers, we add their Logarithms ; to divide, we subtract the Logarithm of the divisor from that of the dividend ; to raise a number to any power, we multiply its Logarithm by the exponent of that power ; and to extract the root of any number, we

divide its Logarithm by the number expressing the root to be found.

This is the same as multiplication and division of different powers of the same letter by each other in Algebra, and involving and evolving powers of a single letter or quantity; the number 10 takes the place of the given letter in Algebra, and the Logarithms are the exponents of 10.

### MULTIPLICATION BY LOGARITHMS.

*Exercises.*

**10.** RULE. Add the Logarithms of the factors, and the sum will be the Logarithm of the product.

1. Multiply 347.676 by 475.2. Ans. 165215.6352.
2. Find the product of 568, 7496, 846, and 1728.  
Ans. 6224314285714.

(It must be carefully borne in mind that the decimal part of the Logarithm is *always* positive.)

3. Multiply 0.00756 by 17.5.

Log. of	0.00756	3.878522
"	17.5	1.243038
Product,	0.1323.	Log. 1.121560

4. Multiply 0.0004756 by 1355.

Although negative quantities have no Logarithms, yet, since the *numerical* product is the same whether the factors are positive or negative, we can use Logarithms in multiplying when one or more of the factors are negative, taking care to prefix to the product the proper sign according to the rules of Algebra.

- When a factor is negative, to the Logarithm which is used *n* is appended.

- E. g. 5. Multiply —75.46 by 54.5.

Log. of	—75.46	1.877717 n
"	54.5	1.736397

Product, —4112.57.

Log. 3.614114 n

(Log. of —75.46, though incorrect, is used for the sake of brevity.)

6. Find the product of —0.017, 25, and —165.4.
7. Find the product of —14, —7.643, and —0.004.

Ans. —428008.

### DIVISION BY LOGARITHMS.

**11. RULE.** From the Logarithm of the dividend subtract the Logarithm of the divisor, and the remainder will be the Logarithm of the quotient.

E. g. 1. Divide 78.46 by 0.00147.

Log. of 78.46	1.894648
“ 0.00147	<u>3.167317</u>
Quotient, 53374.1.	Log. 4.727331

2. Divide 0.0014 by 756.

Log. of 0.0014	3.146128
“ 756	<u>2.878522</u>
Quotient, 0.000001852.	Log. 6.267606

Negative numbers can be divided in the same manner as positive, taking care to prefix to the quotient the proper sign, according to the rules of Algebra.

3. Divide .7478 by 0.00456. Ans. 163.99+.
4. Divide 5000 by 0.00149.
5. Divide 0.00997 by 64.16. Ans. 0.00015539+.
6. Divide —14.55 by 543. Ans. —0.0267955+.
7. Divide —465 by —19.45. Ans. 23.9074+.

### INVOLUTION BY LOGARITHMS.

**12. RULE.** Multiply the Logarithm of the number by the exponent of the power required.

1. Find the 15th power of 1.17.

Log. of 1.17	0.068186
	15
Ans. 10.538.	Log. 1.022790

2. Find the 5th power of 0.00941.

$$\begin{array}{r} \text{Log. of } 0.00941 \\ \hline 3.973590 \\ 5 \end{array}$$

$$\text{Ans. } 0.00000000073782. \quad \text{Log. } \overline{11.867950}$$

3. Find the 4th power of 0.0176. Ans. 0.00000095951+.

4. Find the 9th power of 1.179. Ans. 4.401765+.

Negative numbers are involved in the same manner, taking care to prefix to the power the proper sign, according to the rules of Algebra.

5. Find the 3d power of —0.017. Ans. —0.000004913.

6. Find the 6th power of —14. Ans. 7529536.

#### EVOLUTION BY LOGARITHMS.

- 13. RULE.** Divide the Logarithm of the number by the exponent of the root required.

Negative numbers are evolved in the same manner, taking care to prefix to the root the proper sign, according to the rules of Algebra. For the sake of convenience, where the characteristic of a Logarithm is negative, and not divisible by the index of the root, we can increase the negative characteristic so as to make it divisible, providing we prefix an equal positive number to the decimal part of the Logarithm.

- E. g. 1. Find the 5th root of 0.0173.

Log. of 0.0173 is  $\bar{2}.238046$ , which is equal to  $\bar{5} + 3.238046$ , and dividing this by 5 gives  $\bar{1}.647609$ , which is the Log. of 0.4442.

2. Find the 3d root of 80.07. Ans. 4.31013+.  
 3. Find the 8th root of 0.0764. Ans. .72508+.  
 4. Find the 7th root of —17. Ans. —1.49891+.  
 5. Find the 5th root of —0.00496. Ans. —0.34601+.

- 14.** Instead of subtracting one Logarithm from another, it is sometimes more convenient to add what it lacks of 10,— which difference is called the complement,— and from

the sum reject 10. The result is evidently the same. For  
 $x - y = x + (10 - y) - 10$ . The complement is easiest found  
by beginning at the left of the Logarithm of the number, and  
subtracting each figure from 9, except the last significant fig-  
ure, which must be subtracted from 10.

In proportion, therefore, we have the following rule:

Add the complement of the Logarithm of the first term to the Logarithms of the second and third terms, and from the sum reject 10.

E. g. 1. Find a fourth proportional to 14, 175, and 7486.

Complement of Log. of	14,	8.853872
"	175,	2.243038
"	7486,	3.874250

Ans. 93575. Log. 4.971160

2. Given the first three terms of a proportion, 416, 584, and 256, to find the fourth. Ans. 359.38+

3. Find the value of  $179 \times 4968 \div 489$ .

Ans. 1818.552+

4. Find the value of  $\frac{1748 \times 917}{654 \times 513}$ . Ans. 4.7776+

5. Find the value of  $\frac{\sqrt{0.1739}}{331.9 (\sqrt{2.04} + \sqrt{1.203})^2}$ .  
 Ans. 0.000197055.

Ans. 0.000197055.

$$6. \text{ Find the value of } \frac{23.3 \times 6.764 \times \frac{85.31}{253.4}}{\sqrt[3]{47.64} \left( \frac{2.768}{9.853} \right)^5 \times 9.97}.$$

Ans. 838.965+.

7. In a system whose base is 4, what is the Logarithm of 4? of 16? of 64? of 2? of 8? of 1? of  $\frac{1}{2}$ ? of  $\frac{1}{4}$ ? of  $\frac{1}{8}$ ? of 0?

8. Solve the equation  $125^x = 25$ .

$$x \times \text{Log. } 125 = \text{Log. } 25$$

$$x = \frac{\text{Log. } 25}{\text{Log. } 125} = \frac{1.39794}{2.09691} = \frac{2}{3}, \text{ Ans.}$$

9. Solve the equation  $2048^x = 16$ .

## CHAPTER II.

### TRIGONOMETRIC FUNCTIONS.

#### DEFINITIONS.

**15.** Trigonometry is that branch of mathematics which treats of methods of computing angles and triangles.

**16.** Plane Trigonometry treats of methods of computing plane angles and triangles.

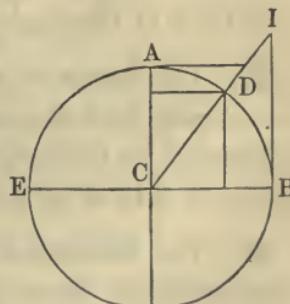

**17.** The circumference of every circle is divided into 360 equal parts, called degrees ( $^{\circ}$ ), each degree into 60 equal parts, called minutes ( $'$ ), and each minute into 60 equal parts, called seconds ( $''$ ).

**18.** As angles at the centre vary as their arcs, or arcs as their corresponding angles, the measure of an angle is the arc included between its sides and described from its vertex as a centre (Geom., III. 14).

**19.** As the sum of all the angles about the point C is equal to four right angles, one right angle, A C B, would be measured by one quarter of the circumference, or  $90^{\circ}$  (Geom., III. 15).

**20.** The Complement of an arc or angle is  $90^{\circ}$  minus this arc or angle. Thus, the arc A D is the complement of D B, and the angle A C D of D C B. When an arc or angle is greater than  $90^{\circ}$ , its complement is negative.

**21.** The Supplement of an arc or angle is  $180^{\circ}$  minus this arc or angle. Thus, the arc E A D is the supplement of D B, and the angle E C D of D C B. When an arc or angle is greater than  $180^{\circ}$ , its supplement is negative.

22. \* The **Sine** of an arc or angle is the line drawn from one end of the arc, perpendicular to the diameter passing through the other end; or it is half the chord of double the arc. Thus, D F is the Sine of the arc D B, or of the angle D C B.

**23.** The **Versed Sine** of an arc or angle is that part of the diameter which is between the foot of the sine and the arc. Thus,  $BF$  is the Versed Sine of the arc  $BD$ , or of the angle  $BCD$ .

**24.** The **Cosine** of an arc or angle is the sine of the complement of the arc or angle, or the radius minus the versed sine of the arc or angle. Thus,  $HD = CF$  is the Cosine of the arc  $BD$ , or of the angle  $BCD$ .

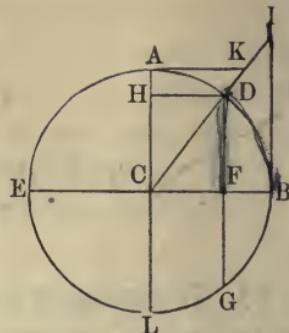

(Co in Cosine, &c., stands for complement.)

**25.** The **Tangent** of an arc or angle (in Trigonometry) is the line touching one extremity of the arc, and terminated by a line drawn from the centre through the other extremity. Thus, BI is the Tangent of the arc BD, or of the angle BCD.

**26.** The **Cotangent** of an arc or angle is the tangent of the complement of the arc or angle. Thus, A K is the Cotangent of B D, or of the angle B C D.

**27.** The **Secant** of an arc or angle (in Trigonometry) is the line drawn from the centre through one end of the arc, and terminated by the tangent to the other end. Thus, CI is the Secant of BD, or of the angle BCD.

**28.** The **Cosecant** of an arc or angle is the secant of the complement of the arc or angle. Thus, C K is the Cosecant of B D, or of the angle B C D.

\* Those who prefer the Analytical Method will turn from this point to Chapter IV.

**29.** The Sine, Tangent, and Secant of the supplement of an arc are (irrespective of the signs) the same as for the arc itself.

The Sine and Cosine of an arc form the two sides of a right-angled triangle whose hypotenuse is the Radius of the arc.

The Radius and Tangent of an arc form the two sides of a right-angled triangle whose hypotenuse is the Secant of the arc.

**30.** Suppose the Radius C D to move in the plane of the circle about the centre C : let it move so that the arc B D and the angle B C D become  $0^\circ$ ; then the Sine, Tangent, and Versed Sine of the arc or angle become  $0$ ; the Secant and Cosine equal to Radius; the Cosecant and Cotangent infinite.

If C D moves toward A until the arc B D or the angle B C D becomes  $30^\circ$ , then, if Radius is unity,

$$D F, \text{ or Sine } 30^\circ = \frac{1}{2}$$

For the Sine D F is half the chord of double the arc, that is, is half of D G, which, as it subtends sixty degrees, or one sixth of the circumference, is equal to Radius (Geom., III. 33).

If C D moves until the arc B D or the angle B C D becomes  $45^\circ$ , then the triangle C D F becomes isosceles; and if Radius is unity, we have

$$F D^2 + F C^2 = 2 D F^2 = C D^2,$$

Hence

$$D F = C D \sqrt{\frac{1}{2}}$$

or

$$\text{Sine } 45^\circ = \sqrt{\frac{1}{2}} = \frac{1}{2}\sqrt{2}$$

The Tangent, in this case, equals the Radius.

If C D moves until B D, or B C D, becomes  $60^\circ$ , then since

$$D F = \sqrt{C D^2 - C F^2}$$

and  $C F = \text{Sine of } A D = \text{Sine } 30^\circ = \frac{1}{2}$

$$D F, \text{ or Sine } 60^\circ = \sqrt{1 - \frac{1}{4}} = \sqrt{\frac{3}{4}} = \frac{1}{2}\sqrt{3}$$

If C D moves until the arc B D, or the angle B C D, becomes  $90^\circ$ , then the Sine, Versed Sine, and Cosecant become equal to Radius; the Cosine and Cotangent 0; the Secant and Tangent infinite.

If we suppose C D to move until the point D passes entirely round the circumference, it will be easy to trace the changes in the length of the Sine, Cosine, &c.

**31.** The centre C is the absolute zero point.

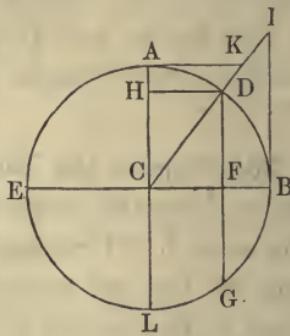

If we consider a line extending in one direction plus, a line extending in the opposite direction should be considered minus. It has been agreed to consider the trigonometric lines which extend from E B upward, or from A L to the right, plus; therefore all those extending from B E downward, or from A L to the left, must be considered minus. It will on inspection be found that these lines change their direction at the point where they become 0, or infinite. Therefore, the algebraic signs of the Sines, Cosines, &c., change from plus to minus, or minus to plus, as each passes the point where it becomes 0, or infinite. These changes in the signs will be found to be as follows :

	1st quadr.	2d quadr.	3d quadr.	4th quadr.
Sine and Cosecant	+	+	-	-
Cosine and Secant	+	-	-	+
Tangent and Cotangent	+	-	+	-

**32.** By various methods, the Sines, Cosines, Tangents, and Cotangents have been calculated for every minute of the Quadrant, with Radius as unity ; and the logarithms of these numbers have been taken from the table of logarithms, and, with 10 added to the characteristic, to avoid negative characteristics (that is, the radius assumed is 10000000000), have been arranged in the table entitled Logarithmic Sines and Tangents.

**33.** To find the Logarithmic Sine, Cosine, &c., of any arc or angle.

In the tables the degrees up to  $45^\circ$  are at the top of the page,

and the minutes on the left ; above  $45^\circ$  (since the Sine, or Tangent, of any arc is the Cosine, or Cotangent, of its complement), the degrees are at the bottom of the page, and the minutes on the right. In the first and second columns, marked D., is the rate of variation per second for the columns at their left, and in the third, marked D., the rate of variation for the columns on both sides of it. In the columns marked D. *the last two figures are to be considered as decimals.*

It must be remembered that, as the arc or angle increases, the Sines and Tangents *increase*, while the Cosines and Cotangents *decrease*.

E. g. The Log. Sine of $37^\circ 10'$ is	9.781134
"        " $74^\circ 50' "$	9.984603

1. Required, the Log. Sine of  $41^\circ 14' 25''$ .

Log. Sine of $41^\circ 14'$ is	9.818969
Number to be added for $25''$ is $25 \times 2.4 =$	60
Ans. 9.819029	

2. Required, the Log. Cosine of  $65^\circ 24' 5''$ .

Log. Cosine of $65^\circ 24'$ is	9.619386
Number to be subtracted for $5''$ is $5 \times 4.6 =$	23
Ans. 9.619363	

*2436"*

34. To find the degrees, minutes, and seconds corresponding to any Logarithmic Sine, Cosine, &c.

Find in the column with the given title (that is, Sine, Cos., Tan., or Cot.) the given logarithm ; if the title is at the top, take the degrees at the top and the minutes on the left ; but if the title is at the bottom, take the degrees at the bottom and the minutes on the right. If the given logarithm is not found exactly, take the degrees and minutes corresponding to the next *less* logarithm for Sines and Tangents, next *greater* for Cosines and Cotangents ; divide the difference of these two logarithms by the corresponding tabular difference D., and the quotient will be the additional number of seconds.

E. g. 1. Required, the degrees, minutes, and seconds corresponding to the Log. Sine 9.874321.

$$\begin{array}{r} 9.874321 \\ \text{Log. Sine } 48^\circ 28'', \quad \underline{9.874232} \\ \underline{1.87)89.00} \\ 48 \qquad \text{Ans. } 48^\circ 28' 48''. \end{array}$$

2. Required, the degrees, &c. corresponding to Log. Cotangent 9.911302.

$$\begin{array}{r} \text{Log. Cotangent } 50^\circ 48', \quad 9.911467 \\ \underline{9.911302} \\ \underline{4.3)165.0} \\ 38 \qquad \text{Ans. } 50^\circ 48' 38''. \end{array}$$

3. Find the Log. Sine of  $13^\circ 10' 31''$ .
4. Find the Log. Sine of  $76^\circ 10' 49''$ .
5. Find the Log. Cosine of  $87^\circ 51' 42''$ .
6. Find the Log. Cosine of  $175^\circ 43' 44''$ .
7. Find the Log. Cotangent of  $17^\circ 16' 14''$ .
8. Find the Log. Cotangent of  $49^\circ 15' 27''$ .
9. Find the Log. Tangent of  $43^\circ 51' 44''$ .
10. Find the Log. Tangent of  $113^\circ 21' 5''$ .
11. Given Log. Sine 8.898611, to find the degrees, &c. corresponding.
12. Given the Log. Tangent 9.47864, to find the degrees, &c. corresponding.
13. Given the Log. Sine 9.90543, to find the degrees, &c. corresponding.
14. Given the Log. Cosine 9.996087, to find the degrees, &c. corresponding.
15. Given the Log. Cosine 9.846321, to find the degrees, &c. corresponding.
16. Given the Log. Cotangent 10.5673 to find the degrees, &c. corresponding.
17. Given the Log. Cotangent 9, to find the degrees, &c. corresponding.

## CHAPTER III.

### SOLUTION OF PLANE TRIANGLES.

**35.** In every plane triangle there are six parts, three sides and three angles. Of these, any three being given, provided one is a side, the others can be found.

#### RIGHT-ANGLED TRIANGLES.

**36.** In a right-angled triangle, one of the six parts, viz. the right angle, is always given; and if one of the acute angles is given, the other is known; therefore, in a right-angled triangle, the number of parts to be considered is four, any two of which being given, the others can be found. We may have four cases, according as there are given,

1. The hypotenuse and an acute angle;
2. A side about the right angle and an acute angle;
3. A side about the right angle and the hypotenuse;
4. The sides about the right angle.

All these cases can be solved by the following Theorem :

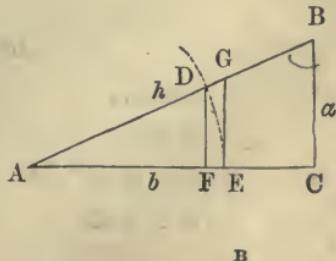

#### THEOREM I.

**37.** *In any right-angled plane triangle,*

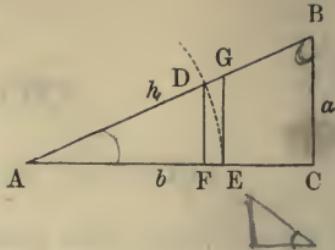

1st. *Radius is to the hypotenuse as the sine of either acute angle is to the opposite side;*

2d. *Radius is to either side as the tangent of the adjacent acute angle is to the opposite side.*

Let  $A B C$  be a triangle, right-angled at  $C$ . Let  $h$  represent the hypotenuse, and  $a$  and  $b$  the sides opposite the angles  $A$  and  $B$  respectively. With either angle, as  $A$ , as a centre, and any radius, (which

radius will represent the radius of the tables,) describe the arc D E; from D draw D F perpendicular to A C, and draw E G parallel to D F. Then D F will be the tabular sine, and G E the tabular tangent of the angle A.

From the similar triangles A D F, A G E, and A B C, we have,

$$\text{1st. } \frac{AD}{R} : \frac{AB}{h} = \frac{DF}{b} : \frac{BC}{a}$$

that is,  $\frac{R}{h} = \sin. A : a$

$$\frac{a}{b} = \frac{b}{a}$$

$$\text{2d. } \frac{AE}{R} : \frac{AC}{b} = \frac{GE}{a}$$

that is,  $\frac{R}{b} = \tan. A : a$

**38. Corollary 1.** As

$$\sin. A = \cos. B$$

$$\frac{R}{h} = \cos. B : a$$

*Sin. 18° 1 a*

**39. Corollary 2.** If radius is unity these proportions will give,

$$a = h \sin. A \quad a = b \tan. A \quad a = h \cos. B$$

### CASE I.

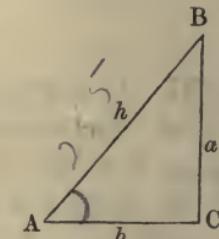

**40. Given the hypotenuse and an acute angle.**

From Theorem I.

$$\frac{R}{h} = \sin. A : a$$

$$\frac{R}{h} = \sin. B, \text{ or } \cos. A : b$$

Ex. 1. Given  $h$  255, A  $57^\circ 14'$ , to find  $a$  and  $b$ .

*By Logarithms.*

Radius	10.
: $h$ 255	2.406540
= $\sin. A$ $57^\circ 14'$	9.924735
: $a$ 214.42	2.331275

A	b	C	Radius	10.
: h 255				2.406540
$\frac{a}{\sin A} = \cos A 57^\circ 14'$				9.733373
: b 138.01				2.139913

$\sin A =$  Ex. 2. Given  $h$  1676,  $A$   $67^\circ 13'$ , to find  $a$  and  $b$ .

$$\text{Ans. } \begin{cases} a & 1545.23 \\ b & 649.03 \end{cases}$$

Ex. 3. Given  $h$  78.4,  $B$   $15^\circ 51'$ , to find  $a$  and  $b$ .

$$22^\circ 47' \quad 42.9721 \quad \text{Ans. } \begin{cases} a & 75.42 \\ b & 21.41 \end{cases}$$

CASE II. 70279

41. Given a side about the right angle and an acute angle.

From Theorem I.

$$\begin{aligned} \sin A : a &= R : h \\ R : h &= \sin B : b \end{aligned}$$

Ex. 1. Given  $a$  195,  $B$   $64^\circ 43'$ , to find  $b$  and  $h$ .

$$\begin{aligned} \sin A &= \cos 64^\circ 43' & \text{comp.} & 0.369476 \\ : a & 195 & & 2.290035 \\ R & & & 10. \\ : h & 456.57 & 25.17 & \hline \\ & & & 2.659511 \end{aligned}$$

$$\begin{aligned} R & & 10. \\ : h & & 2.659511 \\ = \sin B 64^\circ 43' & & 9.956268 \\ : b & 412.84 & \hline \\ & & 2.615779 \end{aligned}$$

Ex. 2. Given  $b$  1075,  $B$   $75^\circ 49'$ , to find  $a$  and  $h$ .

$$\text{Ans. } \begin{cases} a & 271.68 \\ h & 1108.79 \end{cases}$$

Ex. 3. Given  $b$  17.45,  $A$   $47^\circ 31'$ , to find  $a$  and  $h$ .

$$\text{Ans. } \begin{cases} a & 19.05 \\ h & 25.84 \end{cases}$$

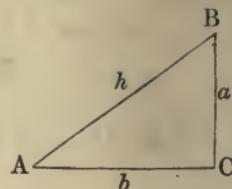

## CASE III.

**42.** Given a side about the right angle and the hypotenuse.

From Theorem I.

$$h : R = a : \sin A$$

$$R : h = \sin B : b$$

Ex. 1. Given  $h$  24.5,  $a$  17.4, to find the other parts.

$$\begin{array}{rcl} h & 24.5 & \text{comp. } 8.610834 \\ : R & & 10. \\ = a & 17.4 & \underline{1.240549} \\ : \sin A & 45^\circ 15' 5'' & 9.851383 \\ & & \end{array}$$

$$B = 90^\circ - 45^\circ 15' 5'' = 44^\circ 44' 55''$$

$$\begin{array}{rcl} R & & 10. \\ : h & 24.5 & 1.389166 \\ = \sin B & 44^\circ 44' 55'' & \underline{9.847571} \\ : b & 17.248 & 1.236737 \end{array}$$

Otherwise  $b$  can be found from the formula  $b^2 = h^2 - a^2$ .

$$\therefore b = \sqrt{(h + a)(h - a)}$$

Ex. 2. Given  $h$  172.8,  $b$  14.17, to find the other parts.

$$\text{Ans. } \left\{ \begin{array}{l} A 85^\circ 17' 47''. \\ B 4^\circ 42' 13''. \\ a 172.218. \end{array} \right.$$

## CASE IV.

**43.** Given the sides about the right angle.

From Theorem I.

$$\begin{array}{l} b : R = a : \tan A \\ \sin A : a = R : h \end{array}$$

Ex. 1. Given  $a$  195,  $b$  147, to find the other parts.

$$\begin{array}{rcl} b & 147 & \text{comp. } 7.832683 \\ : R & & 10. \\ = a & 195 & \underline{2.290035} \\ : \tan A & 52^\circ 59' 22'' & 10.122718 \end{array}$$

$$B = 90^\circ - 52^\circ 59' 22'' = 37^\circ 0' 38''$$

$$\begin{array}{l} \text{sin. A } 52^\circ 59' 22'' \\ : a 195 \\ = R . \\ : h 244.2 \end{array} \quad \begin{array}{l} \text{comp. } 0.097712 \\ 2.290035 \\ 10. \\ \hline 2.387747 \end{array}$$

Otherwise  $h$  can be found from the formula  $h^2 = a^2 + b^2$ ; then the angles by using the first proportion of Theorem I.

Ex. 2. Given  $a$  189,  $b$  14, to find the other parts.

$$\text{Ans. } \begin{cases} A 85^\circ 45' 49''. \\ B 4^\circ 14' 11''. \\ h 189.518. \end{cases}$$

**44.** In the following Examples two parts of a right-angled triangle are given, and the others required.

- |  |   |
|--|---|
| 1. Given $b$ 217, $h$ 915.                     | Ans. $\begin{cases} a 888.896. \\ A 76^\circ 16' 52''. \\ B 13^\circ 43' 8''. \end{cases}$  |
| 2. Given $a$ 174, $b$ 1927.                    | Ans. $\begin{cases} A 5^\circ 9' 34''. \\ B 84^\circ 50' 26''. \\ h 1934.89. \end{cases}$   |
| 3. Given $a$ 17.94, $A$ $15^\circ 39'$ .       | Ans. $\begin{cases} b 64.038. \\ h 66.503. \end{cases}$                                     |
| 4. Given $h$ 47.9, $A$ $59^\circ 17'$ .        | Ans. $\begin{cases} a 41.1798. \\ b 24.467. \end{cases}$                                    |
| 5. Given $a$ 298, $h$ 744.                     | Ans. $\begin{cases} A 23^\circ 36' 42''. \\ B 66^\circ 23' 18''. \\ b 681.712. \end{cases}$ |
| 6. Given $a$ 9.75, $b$ 13.44.                  | Ans. $\begin{cases} A 35^\circ 57' 32''. \\ B 54^\circ 2' 28''. \\ h 16.60. \end{cases}$    |
| 7. Given $b$ 0.02518, $A$ $34^\circ 7' 10''$ . | Ans. $\begin{cases} a 0.01706. \\ h 0.03042. \end{cases}$                                   |

## OBLIQUE-ANGLED TRIANGLES.

*Mondays*

45. In solving oblique-angled triangles, there are four cases  
There may be given,

1. Two angles and a side;
2. Two sides and an angle opposite one of them;
3. Two sides and the included angle;
4. The three sides.

For solving these we demonstrate the three following Theorems.

## THEOREM II.

46. *In any plane triangle, the sides have the same ratio as the sines of the opposite angles.*

Let  $a, b, c$  represent the sides opposite the angles A, B, C, respectively.  
Then

$$a : b : c = \sin. A : \sin. B : \sin. C$$

From B draw BD perpendicular to b.

Then ABD and BDC being right-angled triangles, from Theorem I. we have

$$R : a = \sin. C : BD \quad \therefore R \times BD = a \sin. C$$

$$R : c = \sin. A : BD \quad \therefore R \times BD = c \sin. A$$

Therefore  $a \sin. C = c \sin. A$

or  $a : c = \sin. A : \sin. C$

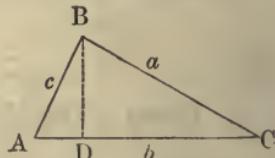

In like manner it can be shown that

$$a : b = \sin. A : \sin. B$$

$$b : c = \sin. B : \sin. C$$

Therefore  $a : b : c = \sin. A : \sin. B : \sin. C$

47. *Scholium.* If one of the angles, as C, should become a

right angle, then  $c$  will become the hypotenuse, and  $\sin. C$  radius, and the proportion will become

$$a : h = \sin. A : R$$

or

$$R : h = \sin. A : a$$

which is the same as the first proportion in Theorem I.

### THEOREM III.

**48.** *In any plane triangle, the sum of any two sides is to their difference, as the tangent of half the sum of the opposite angles is to the tangent of half their difference.*

Let  $A B C$  be a plane triangle; then

$$BC + BA : BC - BA = \tan. \frac{1}{2}(A + C) : \tan. \frac{1}{2}(A - C)$$

Produce  $A B$  to  $D$ , making  $B D$  equal to  $B C$ , and join  $D C$ . Take  $B F$  equal to  $B A$ , draw  $A F$  and produce it to  $E$ .

$$AD = BC + BA$$

$$FC = BC - BA$$

The sum of the two angles  $B A F$  and  $B F A$  is equal to the sum of  $B A C$  and  $B C A$ , as each sum is the supplement of  $A B C$ ; therefore, as  $A B$  is equal to  $B F$ ,

$$B A F = \frac{1}{2}(A + C)$$

If from the greater of two quantities we subtract half their sum, the remainder will be half their difference; therefore,

$$E A C = \frac{1}{2}(A - C)$$

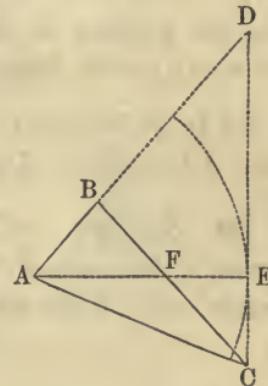

As  $B D$  is equal to  $B C$ , the angles  $B D C$  and  $B C D$  are equal; and  $D A F$  is equal to  $B F A$ , and  $B F A$  to  $C F E$ ; therefore the triangles  $A D E$  and  $F E C$  are mutually equiangular; hence the two angles at  $E$  are equal, and  $A E$  is perpendicular to  $D C$ ; and if with  $A E$  as radius and  $A$  as a centre, an arc is described,  $D E$  becomes the tangent of  $D A E$ , and  $E C$  of  $E A C$ .

By similar triangles we have (Geom. II. 19)

$$AD : FC = DE : EC$$

or

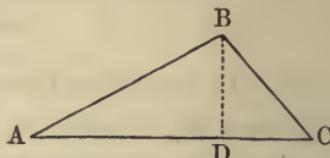

$$BC + BA : BC - BA = \tan. \frac{1}{2}(A + C) : \tan. \frac{1}{2}(A - C)$$

## THEOREM IV.

**49.** If from any angle of a plane triangle a perpendicular be drawn to the opposite side or base, then the sum of the segments of the base will be to the sum of the other two sides as the difference of these sides is to the difference of the segments of the base.

From B, in the triangle ABC,  
draw BD perpendicular to AC.  
Then

$$\begin{aligned} AD + DC : AB + BC &= AB - BC : AD - DC \\ \text{For } BC^2 - DC^2 &= BD^2 = AB^2 - AD^2 \\ \text{or } AD^2 - DC^2 &= AB^2 - BC^2 \end{aligned}$$

As the product of the sum and difference of two quantities is equal to the difference of their squares, we have

$$\begin{aligned} (AD + DC)(AD - DC) &= (AB + BC)(AB - BC) \\ \text{or } AD + DC : AB + BC &= AB - BC : AD - DC \end{aligned}$$

**50. Scholium.** When the perpendicular falls within the triangle, the sum of the segments of the base is equal to the whole base ; when without, the difference.

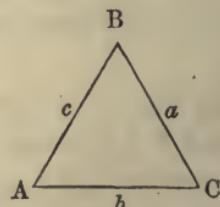

## CASE I.

**51.** Given two angles and a side.

From Theorem II.

$$\sin. A : \sin. B : \sin. C = a : b : c$$

Ex. 1. Given A  $48^\circ$ , C  $55^\circ 17'$ , a 417, to  
find the other parts.

$$B = 180^\circ - (55^\circ 17' + 48^\circ) = 76^\circ 43'$$

sin. A $48^\circ$	comp. 0.128927
: sin. B $76^\circ 43'$	9.988223
= a 417	2.620136
: b 546.12	2.737286

sin. A 48°	comp. 0.128927
: sin. C 55° 17'	9.914860
= a 417	2.620136
: c 461.24	2.663923

Ex. 2. Given A 95° 4', B 25° 14', c 49.17, to find the other parts.

Ans.  $\begin{cases} C 59^\circ 42' \\ a 56.727 \\ b 24.278 \end{cases}$

### CASE II.

52. *Given two sides and an angle opposite to one of them.*

From Theorem II.

$$a : b : c = \sin. A : \sin. B : \sin. C$$

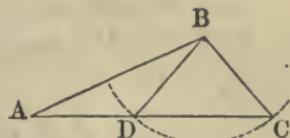

Ex. 1. Given a 55, c 49.87, A 25° 44', to find the other parts.

a 55	comp. 8.259637
: c 49.87	1.697839
= sin. A 25° 44'	9.637673
: sin. C 23° 11' 2"	9.595149

$$B = 180^\circ - (23^\circ 11' 2'' + 25^\circ 44') = 131^\circ 4' 58''$$

sin. C 23° 11' 2''	comp. 0.404851
: sin. B 131° 4' 58''	9.877234
= c 49.87	1.697839
: b 95.483	1.979924

53. If BC, the side opposite the given angle, is less than the other given side AB, and the given angle is acute, there are two triangles which satisfy the conditions, viz. ABC and ABD, in which the angles BCA and BDA are supplements of each other. The Log. sine obtained in working such an example represents

either the angle  $B C A$ , or its supplement  $B D A$  (Art. 29). If the given angle  $A$  is obtuse, or the side opposite the given angle is greater than the other given side, there is but one solution (Geom., VI. 11). Whenever the solution is impossible (Geom., VI. 12), the Log. sine obtained in working the example will be greater than radius, which is absurd.

Ex. 2. Given  $a$  95.5,  $c$  173.2,  $A$   $27^\circ 4'$ , to find the other parts.

$$\text{Ans. } \begin{cases} C 55^\circ 36' 47'', \\ B 97^\circ 19' 13'', \\ b 208.17, \end{cases} \text{ or } \begin{cases} C 124^\circ 23' 13'', \\ B 28^\circ 32' 47'', \\ b 100.29. \end{cases}$$

### CASE III.

**54.** *Given two sides and the included angle.*

From Theorem III.

$$a + c : a - c = \tan. \frac{1}{2} (A + C) : \tan. \frac{1}{2} (A - C)$$

From Theorem II.

$$\sin. A : \sin. B : \sin. C = a : b : c$$

Ex. 1. Given  $a$  976,  $c$  89,  $B$   $51^\circ 17'$ , to find the other parts.

$$\begin{array}{rcl} \frac{1}{2} (A + C) & = & \frac{1}{2} (180^\circ - 51^\circ 17') = 64^\circ 21' 30'' \\ a + c & = & 1065 \quad \text{comp. } 6.972650 \\ : a - c & = & 887 \quad 2.947924 \\ = \tan. \frac{1}{2} (A + C) & = & \tan. 64^\circ 21' 30'' \quad 10.318746 \\ : \tan. \frac{1}{2} (A - C) & = & \tan. 60^\circ 2' 36'' \quad \underline{10.239320} \end{array}$$

Half the sum plus half the difference gives the greater angle  $A$   $124^\circ 24' 6''$ ; half the sum minus half the difference, the less  $C$   $4^\circ 18' 54''$ .

$$\begin{array}{rcl} \sin. C 4^\circ 18' 54'' & & \text{comp. } 1.123553 \\ : \sin. B 51^\circ 17' & & 9.892233 \\ = c 89 & & 1.949390 \\ : b 922.94 & & \underline{2.965176} \end{array}$$

Ex. 2. Given  $a$  91,  $b$  104,  $C$   $14^\circ 30'$ , to find the other parts.

$$\text{Ans. } \begin{cases} A 55^\circ 5' 37'' \\ B 110^\circ 24' 23'' \\ c 27.783. \end{cases}$$

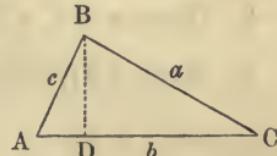

## CASE IV.

**55.** Given the three sides.

From B let fall a perpendicular upon  $b$ .

From Theorem IV.

$$b : a + c = a - c : DC - DA$$

The angles A and C can then be found as in Art. 42.

Ex. 1. Given  $a$  125,  $b$  135,  $c$  75, to find the angles.

$b$ 135	comp. 7.869666
$: a + c$ 200	2.301030
$= a - c$ 50	<u>1.698970</u>
$: DC - DA$ 74.0741	1.869666

$DC$ , therefore, is 104.53, and  $DA$  30.46; the angles A and C can now be found.

$$\begin{aligned} AB : BC &:: AD : DC \quad \text{Ans. } \begin{cases} A 66^\circ 2' 7'' + \\ B 80^\circ 42' 57'' - \\ C 33^\circ 14' 56'' + \end{cases} \\ BC : DC &:: AD : DA \end{aligned}$$

**56.** The sum of any two sides must be greater than the remaining side, otherwise the triangle is impossible.

If the perpendicular is drawn to the longest side, it will fall within the triangle.

The shorter segment of the base is adjacent to the shorter side.

Ex. 2. Given  $a$  347,  $b$  542,  $c$  476, to find the angles.

$$\begin{aligned} b : a + c - a - c + DC - DA &:: DC - DA \quad \text{Ans. } \begin{cases} A 39^\circ 11' 14'' .5 \\ B 80^\circ 43' 43''.5 \\ C 60^\circ 5' 2'' . \end{cases} \\ b - 42 &= 500 \\ a + c - 542 &= 500 \\ C - & \end{aligned}$$

## MISCELLANEOUS EXAMPLES.

1. Given A  $45^\circ 4'$ , B  $75^\circ 35'$ , c 457, to find the other parts.

$$\text{Ans. } \begin{cases} C 59^\circ 21'. \\ a 376.06. \\ b 514.48. \end{cases}$$

2. Given a 454, c 753, A  $45^\circ 25'$ , to find the other parts.

3. Given a 57, b 89, C  $75^\circ 4'$ , to find the other parts.

$$\text{Ans. } \begin{cases} A 36^\circ 32' 37''. \\ B 68^\circ 23' 23''. \\ c 92.495. \end{cases}$$

4. Given a 41, b 74, c 63, to find the other parts.

$$\text{Ans. } \begin{cases} A 33^\circ 37' 26''. \\ B 88^\circ 4' 12''. \\ C 58^\circ 18' 22''. \end{cases}$$

5. Given h 75, a 35, to find the other parts.

$$\text{Ans. } \begin{cases} A 27^\circ 49' 5''. \\ B 62^\circ 10' 55''. \\ b 66.332. \end{cases}$$

6. Given h 919, A  $37^\circ 37'$ , to find the other parts.

$$\text{Ans. } \begin{cases} a 560.94. \\ b 727.95. \end{cases}$$

7. Given b 45.3, A  $34^\circ 23'$ , to find a and h.

$$\text{Ans. } \begin{cases} a 30.998. \\ h 54.890. \end{cases}$$

8. Given a 40, b 57, c 97, to find the other parts.

9. Given a 0.05377, b 0.06607, A  $45^\circ$ , to find the other parts.

$$\text{Ans. } \begin{cases} B 60^\circ 19' 34'', \\ C 74^\circ 40' 26'', \\ c 0.07334, \end{cases} \text{ or } \begin{cases} B 119^\circ 40' 26''. \\ C 15^\circ 19' 34''. \\ c 0.0201. \end{cases}$$

10. Given a 54, b 35, B  $97^\circ 15'$ , to find the other parts.

## CHAPTER IV.

### TRIGONOMETRIC FUNCTIONS.

#### ANALYTICAL METHOD.\*

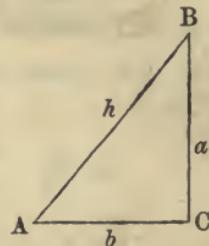

#### DEFINITIONS.

**57.** Instead of considering the Sine, Tangent, &c. as lines, having a certain position in a circle, and varying not only as the arc, but also as the radius, we consider them, in this system, as ratios, varying only as the angle, and capable of being represented by certain lines in a circle only when the radius is unity.

**58.** The **Sine** of an angle is the ratio of the side opposite it in a right-angled triangle to the hypotenuse.

That is, if in any right-angled triangle A B C we represent the hypotenuse by  $h$ , and the sides opposite the angles A and B by  $a$  and  $b$  respectively,

$$\sin. A = \frac{a}{h} \qquad \sin. B = \frac{b}{h} \quad (1)$$

**59.** The **Tangent** of an angle is the ratio of the side opposite it in a right-angled triangle to the side adjacent.

$$\text{That is } \tan. A = \frac{a}{b} \qquad \tan. B = \frac{b}{a} \quad (2)$$

**60.** The **Secant** of an angle is the ratio of the hypotenuse to the side adjacent to the angle.

$$\text{That is } \sec. A = \frac{h}{b} \qquad \sec. B = \frac{h}{a} \quad (3)$$

**61.** The **Cosine**, **Cotangent**, **Cosecant** of an angle are respectively the sine, tangent, and secant of its complement.

---

\* Those who have taken the Geometrical Method can omit Chapters IV. and V.

Therefore, as the acute angles of a right-angled triangle are complements of each other, we shall have

$$\left. \begin{array}{l} \cos. A = \sin. B = \frac{b}{h} \\ \cos. B = \sin. A = \frac{a}{h} \\ \cot. A = \tan. B = \frac{b}{a} \\ \cot. B = \tan. A = \frac{a}{b} \\ \operatorname{cosec}. A = \sec. B = \frac{h}{a} \\ \operatorname{cosec}. B = \sec. A = \frac{h}{b} \end{array} \right\} \quad (4)$$

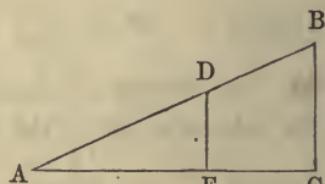

**62.** By inspecting these equations it will be seen that the sine and cosecant of an angle are reciprocals of each other; so also the cosine and secant, and the tangent and cotangent. That is

$$\left. \begin{array}{ll} \sin. A = \frac{1}{\operatorname{cosec}. A} & \text{or } \operatorname{cosec}. A = \frac{1}{\sin. A} \\ \cos. A = \frac{1}{\sec. A} & \text{or } \sec. A = \frac{1}{\cos. A} \\ \tan. A = \frac{1}{\cot. A} & \text{or } \cot. A = \frac{1}{\tan. A} \end{array} \right\} \quad (5)$$

**63.** *The sine, cosine, &c., vary only as the angle; that is, for a given angle they are constant.*

Let A D E and A B C be any two right-angled triangles, having a common angle A; they are equiangular and similar.

Hence

$$D E : D A = B C : B A, \text{ or } \frac{D E}{D A} = \frac{B C}{B A} = \sin. A$$

that is, the sine of the angle A is constant, whatever the length of the sides. In the same way it can be proved that the cosine, tangent, &c. of a given angle are constant.

**64.** *The sine, cosine, &c. can be represented by certain lines in a circle, when the radius is unity.*

Let  $CDF$  be a triangle, right-angled at  $F$ . With  $C$  as a centre and  $CD$  as radius, describe a circle  $BAE$ ; produce  $CF$  to  $B$ , and draw  $BI$  parallel to  $FD$ , and meeting  $CD$  produced; draw  $CA$  perpendicular, and  $DH$  and  $AK$  parallel to  $CB$ .

In the right-angled triangle  $CDF$

$$\sin. C = \frac{DF}{DC}$$

$$\cos. C = \frac{CF}{CD} = \frac{HD}{CD}$$

$$\tan. C = \frac{DF}{FC} = \frac{BI}{BC}$$

$$\cot. C = \frac{CF}{FD} = \frac{HD}{HC} = \frac{AK}{AC}$$

$$\sec. C = \frac{CD}{CF} = \frac{CI}{CB}$$

$$\text{cosec. } C = \frac{CD}{DF} = \frac{CD}{CH} = \frac{CK}{CA}$$

If  $CA$ ,  $CD$ ,  $CB$ , that is, radius, becomes unity, we shall have

$$\sin. C = DF$$

$$\cos. C = DH$$

$$\tan. C = BI$$

$$\cot. C = AK$$

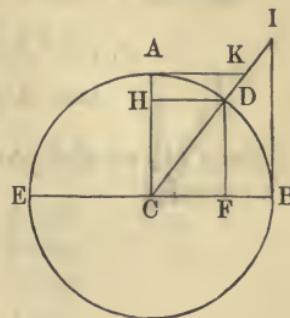

$$\sec. C = CI$$

$$\text{cosec. } C = CK$$

In the Geometrical Method, *without limiting the radius to unity*, these lines are defined as the sine, cosine, &c. of the arc or angle to which they belong.

**65.** In the right-angled triangle  $ABC$  (Art. 58)

$$a^2 + b^2 = h^2 \quad (6)$$

From (4)\* and (6) we have

$$\sin^2 A + \cos^2 A = \frac{a^2}{h^2} + \frac{b^2}{h^2} = \frac{a^2 + b^2}{h^2} = \frac{h^2}{h^2} = 1 \quad (7)$$

$$\therefore \cos^2 A = 1 - \sin^2 A$$

$$\cos. A = \sqrt{1 - \sin^2 A} \quad (8)$$

From (4) we also have

$$\frac{\sin. A}{\cos. A} = \frac{a}{h} \div \frac{b}{h} = \frac{a}{b} = \tan. A$$

$$\frac{\sin. A}{\cos. A} = \tan. A \quad (9)$$

If, therefore, the sine of an angle is known, the cosine can be found by (8), the tangent by (9), then the cotangent, the secant, and cosecant by (5).

**66. Problem.** To find the sine and cosine of the sum and difference of two angles, when their sines and cosines are known.

Let  $FCL$  and  $DCF$  be two angles, represented respectively by  $A$  and  $B$ .

Draw  $CH$ , so as to make the angle  $FCH = DCF$ ; then

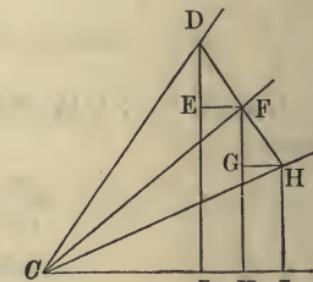

$$DCL = A + B$$

$$HCL = A - B$$

From the points  $D$  and  $H$ , equally distant from  $C$ , draw  $DI$  and  $HL$  perpendicular to  $CL$ ; join  $DH$  and draw  $FK$  perpendicular, and  $FE$  and  $HG$  parallel to  $CL$ .

The triangles  $CDF$  and  $CFH$  are equal.

For by construction  $CD$  and  $CH$  and the angles  $DCF$  and  $FCH$  are equal, and  $CF$  is common; therefore  $DF$  is equal

\* In the Analytical Method these numbers standing alone in parentheses refer to the equations with the same number.

to  $FH$ , and  $DH$  is perpendicular to  $CF$ ; and the triangles  $DEF$  and  $FGH$  are also equal. The triangles  $EDF$  and  $FCK$ , having their sides perpendicular each to each, are similar; therefore the angle  $EDF = FCK = A$ .

Now

$$\sin. (A + B) = \frac{DI}{DC} = \frac{FK + DE}{DC} = \frac{FK}{DC} + \frac{DE}{DC} \quad (10)$$

$$\sin. (A - B) = \frac{HL}{HC} = \frac{FK - DE}{DC} = \frac{FK}{DC} - \frac{DE}{DC} \quad (11)$$

But

$$\left. \begin{aligned} \frac{FK}{DC} &= \frac{FK}{DC} \times \frac{FC}{FC} = \frac{FK}{FC} \times \frac{FC}{DC} = \sin. A \cos. B \\ \frac{DE}{DC} &= \frac{DE}{DC} \times \frac{DF}{DF} = \frac{DE}{DF} \times \frac{DF}{DC} = \cos. A \sin. B \end{aligned} \right\} \quad (12)$$

By (12), (10) and (11) become

$$\sin. (A + B) = \sin. A \cos. B + \cos. A \sin. B \quad (13)$$

$$\sin. (A - B) = \sin. A \cos. B - \cos. A \sin. B \quad (14)$$

Again,

$$\cos. (A + B) = \frac{CI}{CD} = \frac{CK - EF}{CD} = \frac{CK}{CD} - \frac{EF}{CD} \quad (15)$$

$$\cos. (A - B) = \frac{CL}{CH} = \frac{CK + EF}{CD} = \frac{CK}{CD} + \frac{EF}{CD} \quad (16)$$

But

$$\left. \begin{aligned} \frac{CK}{CD} &= \frac{CK}{CD} \times \frac{CF}{CF} = \frac{CK}{CF} \times \frac{CF}{CD} = \cos. A \cos. B \\ \frac{EF}{CD} &= \frac{EF}{CD} \times \frac{DF}{DF} = \frac{EF}{DF} \times \frac{DF}{CD} = \sin. A \sin. B \end{aligned} \right\} \quad (17)$$

By (17), (15) and (16) become

$$\cos. (A + B) = \cos. A \cos. B - \sin. A \sin. B \quad (18)$$

$$\cos. (A - B) = \cos. A \cos. B + \sin. A \sin. B \quad (19)$$

We can write (13) and (14) in one formula in which the upper signs correspond to each other, and also the lower ones; so also (18) and (19), as follows :

$$\begin{aligned}\sin. (A \pm B) &= \sin. A \cos. B \pm \cos. A \sin. B \\ \cos. (A \pm B) &= \cos. A \cos. B \mp \sin. A \sin. B\end{aligned}\} \quad (20)$$

**67. Theorem.** *The sum of the sines of two angles is to the difference of their sines as the tangent of half their sum is to the tangent of half their difference.*

The sum of (13) and (14) is

$$\sin. (A + B) + \sin. (A - B) = 2 \sin. A \cos. B \quad (21)$$

Their difference is

$$\sin. (A + B) - \sin. (A - B) = 2 \cos. A \sin. B \quad (22)$$

If in (21) and (22) we make

$$A + B = M, \text{ and } A - B = N$$

that is,

$$A = \frac{1}{2}(M + N), \text{ and } B = \frac{1}{2}(M - N)$$

they become

$$\sin. M + \sin. N = 2 \sin. \frac{1}{2}(M + N) \cos. \frac{1}{2}(M - N) \quad (23)$$

$$\sin. M - \sin. N = 2 \cos. \frac{1}{2}(M + N) \sin. \frac{1}{2}(M - N) \quad (24)$$

Dividing (23) by (24), we have

$$\frac{\sin. M + \sin. N}{\sin. M - \sin. N} = \frac{\sin. \frac{1}{2}(M + N) \cos. \frac{1}{2}(M - N)}{\cos. \frac{1}{2}(M + N) \sin. \frac{1}{2}(M - N)}$$

Reducing the second member by means of (9), we have

$$\frac{\sin. M + \sin. N}{\sin. M - \sin. N} = \frac{\tan. \frac{1}{2}(M + N)}{\tan. \frac{1}{2}(M - N)} \quad (25)$$

**68.** By means of the formulas already obtained, the sine, cosine, &c. of angles of any magnitude can be found.

**69.** *To find the sine, &c. of  $30^\circ$  and  $60^\circ$ .*

In (13) make  $A = 30^\circ$ , and  $B = 30^\circ$ ; as  $30^\circ$  and  $60^\circ$  are complements of each other, it becomes

$$\begin{aligned}\sin. 60^\circ &= \cos. 30^\circ = \sin. 30^\circ \cos. 30^\circ + \cos. 30^\circ \sin. 30^\circ \\ &= 2 \sin. 30^\circ \cos. 30^\circ\end{aligned}$$

Dividing by  $\cos. 30^\circ$ , we have

$$\left. \begin{aligned}1 &= 2 \sin. 30^\circ \\ \sin. 30^\circ &= \frac{1}{2} = \cos. 60^\circ\end{aligned} \right\}$$

whence by (5), (8), and (9)

$$\left. \begin{aligned}\cos. 30^\circ &= \sin. 60^\circ = \sqrt{1 - \sin^2 30^\circ} = \sqrt{1 - \frac{1}{4}} = \frac{1}{2}\sqrt{3} \\ \tan. 30^\circ &= \cot. 60^\circ = \frac{\frac{1}{2}}{\frac{1}{2}\sqrt{3}} = \frac{1}{\sqrt{3}} = \sqrt{\frac{1}{3}} \\ \cot. 30^\circ &= \tan. 60^\circ = \frac{1}{\sqrt{\frac{1}{3}}} = \sqrt{3} \\ \sec. 30^\circ &= \text{cosec. } 60^\circ = \frac{1}{\frac{1}{2}\sqrt{3}} = \frac{2}{\sqrt{3}} \\ \text{cosec. } 30^\circ &= \sec. 60^\circ = \frac{1}{\frac{1}{2}} = 2\end{aligned} \right\} (26)$$

**70.** *To find the sine, &c. of  $45^\circ$ .*

In (7) make  $A = 45^\circ$ ; as  $45^\circ$  is complement of  $45^\circ$ , it becomes

$$\begin{aligned}\sin^2 45^\circ + \cos^2 45^\circ &= 2 \sin^2 45^\circ = 2 \cos^2 45^\circ = 1 \\ \sin. 45^\circ &= \cos. 45^\circ = \sqrt{\frac{1}{2}}\end{aligned}$$

whence, by (5) and (9)

$$\left. \begin{aligned}\tan. 45^\circ &= \cot. 45^\circ = \frac{\sin. 45^\circ}{\cos. 45^\circ} = 1 \\ \sec. 45^\circ &= \text{cosec. } 45^\circ = \frac{1}{\cos. 45^\circ} = \frac{1}{\sqrt{\frac{1}{2}}} = \sqrt{2}\end{aligned} \right\} (27)$$

**71.** *To find the sine, &c. of  $0^\circ$  and  $90^\circ$ .*

In the right-angled triangle A B C (Art. 63) let A B revolve in the plane A B C about A as a centre; when the angle A = 0, B C = 0, and A C = A B; then

$$\left. \begin{array}{l} \sin. A = \sin. 0^\circ = \cos. 90^\circ = \frac{BC}{AB} = 0 \\ \cos. A = \cos. 0^\circ = \sin. 90^\circ = \frac{AC}{AB} = 1 \end{array} \right\}$$

whence, by (5) and (9) we have

$$\left. \begin{array}{l} \tan. 0^\circ = \cot. 90^\circ = \frac{\sin. 0^\circ}{\cos. 0^\circ} = \frac{0}{1} = 0 \\ \tan. 90^\circ = \cot. 0^\circ = \frac{\sin. 90^\circ}{\cos. 90^\circ} = \frac{1}{0} = \infty \\ \sec. 0^\circ = \text{cosec. } 90^\circ = \frac{1}{\cos. 0^\circ} = \frac{1}{1} = 1 \\ \sec. 90^\circ = \text{cosec. } 0^\circ = \frac{1}{\cos. 90^\circ} = \frac{1}{0} = \infty \end{array} \right\} (28)$$

### 72. To find the sine, &c. of $180^\circ$ .

In (13) and (18) make  $A = 90^\circ$ , and  $B = 90^\circ$ ; they become by means of (28)

$$\left. \begin{array}{l} \sin. 180^\circ = \sin. 90^\circ \cos. 90^\circ + \cos. 90^\circ \sin. 90^\circ = 0 \\ \cos. 180^\circ = \cos. 90^\circ \cos. 90^\circ - \sin. 90^\circ \sin. 90^\circ = -1 \end{array} \right\}$$

whence, by (5) and (9),

$$\left. \begin{array}{l} \tan. 180^\circ = \frac{\sin. 180^\circ}{\cos. 180^\circ} = \frac{0}{-1} = 0 \\ \cot. 180^\circ = \frac{\cos. 180^\circ}{\sin. 180^\circ} = \frac{-1}{0} = \infty * \\ \sec. 180^\circ = \frac{1}{\cos. 180^\circ} = \frac{1}{-1} = -1 \\ \text{cosec. } 180^\circ = \frac{1}{\sin. 180^\circ} = \frac{1}{0} = \infty \end{array} \right\} (29)$$

### 73. To find the sine, &c. of $270^\circ$ .

In (13) and (18) make  $A = 180^\circ$ , and  $B = 90^\circ$ ; they become by means of (28) and (29)

---

\* As  $0 = -0$ ,  $\frac{-1}{0} = \frac{-1}{-0} = \pm \infty$

$$\begin{aligned}\sin. 270^\circ &= \sin. 180^\circ \cos. 90^\circ + \cos. 180^\circ \sin. 90^\circ = -1 \\ \cos. 270^\circ &= \cos. 180^\circ \cos. 90^\circ - \sin. 180^\circ \sin. 90^\circ = 0\end{aligned}$$

whence, from (5) and (9)

$$\left. \begin{aligned}\tan. 270^\circ &= \frac{\sin. 270^\circ}{\cos. 270^\circ} = \frac{-1}{0} = \infty \\ \cot. 270^\circ &= \frac{\cos. 270^\circ}{\sin. 270^\circ} = \frac{0}{-1} = 0 \\ \sec. 270^\circ &= \frac{1}{\cos. 270^\circ} = \frac{1}{0} = \infty \\ \text{cosec. } 270^\circ &= \frac{1}{\sin. 270^\circ} = \frac{1}{-1} = -1\end{aligned} \right\} \quad (30)$$

#### 74. To find the sine, &c. of $360^\circ$ .

In (13) and (18) make  $A = 180^\circ$ , and  $B = 180^\circ$ ; they become by means of (29)

$$\begin{aligned}\sin. 360^\circ &= \sin. 180^\circ \cos. 180^\circ + \cos. 180^\circ \sin. 180^\circ = 0 = \sin. 0^\circ \\ \cos. 360^\circ &= \cos. 180^\circ \cos. 180^\circ - \sin. 180^\circ \sin. 180^\circ = 1 = \cos. 0^\circ\end{aligned}\quad (31)$$

Hence the sine, cosine, &c. of  $360^\circ$  are the same as those of  $0^\circ$ .

#### 75. To find the sine, &c. of any angle.

The semi-circumference of a circle whose radius is unity is 3.14159265359. If we divide this by 10800, the number of minutes in the semi-circumference, it will give the length of the arc of  $1' = 0.000290888$ , which may also be considered the sine of an angle of  $1'$  (Arts. 64, 63, and Geom., III. 25).

Hence by (8) we have

$$\cos. 1' = \sqrt{1 - \sin^2 1'} = .9999999577$$

Then by transposing (21)

$$\sin. (A + B) = 2 \sin. A \cos. B - \sin. (A - B)$$

and making  $B = 1'$ , and  $A = 1', 2', 3', \&c.$  in succession, we obtain for the sines

$$\sin. 2' = 2 \sin. 1' \cos. 1' - \sin. 0' = .0005817764$$

$$\sin. 3 = 2 \sin. 2' \cos. 1' - \sin. 1' = .0008726646$$

$\&c.$                      $\&c.$                      $\&c.$

**76.** Having found the sines up to  $45^\circ$ , the cosines up to  $45^\circ$  can be found by (8) :

$$\cos. 2' = \sqrt{1 - \sin^2 2'} = .9999998308$$

$$\cos. 3' = \sqrt{1 - \sin^2 3'} = .9999996193$$

&c. &c. &c.

**77.** As the sine of an angle is the cosine of its complement, the sines and cosines now become known up to  $90^\circ$ . The tangents, cotangents, secants, and cosecants can now be found by (5) and (9).

**78.** The sines, cosines, &c. of all angles up to  $360^\circ$  are now known ; since, disregarding the algebraic signs, they are the same between  $90^\circ$  and  $180^\circ$ ,  $180^\circ$  and  $270^\circ$ , and  $270^\circ$  and  $360^\circ$ , as between  $0^\circ$  and  $90^\circ$ . This will become evident as we proceed to find the algebraic signs of the sines, cosines, &c.

**79.** *Problem.* To find the algebraic signs of the sines, cosines, &c.

For angles between  $0^\circ$  and  $90^\circ$ .

Since the trigonometric functions between these limits are the ratios of lines which we assume as positive, the functions themselves must be positive.

**80.** For angles between  $90^\circ$  and  $180^\circ$ .

In (14) and (19) make  $A = 180^\circ$ , and  $B < 90^\circ$ ; they become by means of (29)

$$\sin. (180^\circ - B) = \sin. 180^\circ \cos. B - \cos. 180^\circ \sin. B = \sin. B$$

$$\cos. (180^\circ - B) = \cos. 180^\circ \cos. B + \sin. 180^\circ \sin. B = -\cos. B$$

whence by (5) and (9)

$$\tan. (180^\circ - B) = -\tan. B \quad \cot. (180^\circ - B) = -\cot. B$$

$$\sec. (180^\circ - B) = -\sec. B \quad \text{cosec.} (180^\circ - B) = \text{cosec.} B$$

That is, *the sine and cosecant of the supplement of an angle are the same as those of the angle itself; and the cosine, tangent, cotangent, and secant are the negative of those of the angle.*

### 81. For angles which exceed $180^\circ$ .

In (13) and (18) make  $A = 180^\circ$ ; they become by means of (29)

$$\begin{aligned}\sin.(180^\circ + B) &= \sin. 180^\circ \cos. B + \cos. 180^\circ \sin. B = -\sin. B \\ \cos.(180^\circ + B) &= \cos. 180^\circ \cos. B - \sin. 180^\circ \sin. B = -\cos. B\end{aligned}$$

whence by (5) and (9)

$$\begin{aligned}\tan.(180^\circ + B) &= \tan. B & \cot.(180^\circ + B) &= \cot. B \\ \sec.(180^\circ + B) &= -\sec. B & \cosec.(180^\circ + B) &= -\cosec. B\end{aligned}$$

That is, *the tangent and cotangent of an angle which exceeds  $180^\circ$  are equal to those of its excess above  $180^\circ$ , and the sine, cosine, secant, and cosecant of this angle are the negative of those of its excess.*

**82. Corollary 1.** The tangent and cotangent of angles between  $180^\circ$  and  $270^\circ$  are the same as for angles between  $0^\circ$  and  $90^\circ$ , and the sine, cosine, secant, and cosecant are the negative of those between  $0^\circ$  and  $90^\circ$ .

**83. Corollary 2.** The cosine and secant of an angle between  $270^\circ$  and  $360^\circ$  are the same as for angles between  $0^\circ$  and  $90^\circ$ , and the sine, tangent, cotangent, and cosecant are the negative of those between  $0^\circ$  and  $90^\circ$ .

### 84. To find the sine, &c. of angles which exceed $360^\circ$ .

In (13) and (18) make  $A = 360^\circ$ ; they become by means of (31)

$$\begin{aligned}\sin.(360^\circ + B) &= \sin. 360^\circ \cos. B + \cos. 360^\circ \sin. B = \sin. B \\ \cos.(360^\circ + B) &= \cos. 360^\circ \cos. B - \sin. 360^\circ \sin. B = \cos. B\end{aligned}$$

That is, *the sine, cosine, &c. of an angle which exceeds  $360^\circ$  are the same as those of its excess above  $360^\circ$ .*

**85.** To find the sine and cosine of double a given angle.

In (13) and (18) make  $A = B$ , and they become

$$\sin. 2A = 2 \sin. A \cos. A \quad (32)$$

$$\cos. 2A = \cos^2 A - \sin^2 A \quad (33)$$

**86.** To find the sine and cosine of half a given angle.

Finding the sum and difference of (33) and (7), we have

$$2 \cos^2 A = 1 + \cos. 2A, \text{ and } 2 \sin^2 A = 1 - \cos. 2A \quad (34)$$

In (34) substitute  $\frac{1}{2}A$  for  $A$ , and we have

$$2 \cos^2 \frac{1}{2}A = 1 + \cos. A, \text{ and } 2 \sin^2 \frac{1}{2}A = 1 - \cos. A \quad (35)$$

**87.** From the results obtained in the preceding articles we form the following

TABLE.

## CHAPTER V.\*

## SOLUTION OF PLANE TRIANGLES.

## ANALYTICAL METHOD.

**88.** In every plane triangle there are six parts, three sides and three angles. Of these, any three being given, provided one is a side, the others can be found.

## RIGHT-ANGLED TRIANGLES.

**89.** In a right-angled triangle, one of the six parts, viz. the right angle, is always given; and if one of the acute angles is given, the other is known; therefore, in a right-angled triangle, the number of parts to be considered is four, any two of which being given, the others can be found. We may have four cases, according as there are given,

1. The hypothenuse and an acute angle;
2. A side about the right angle and an acute angle;
3. A side about the right angle and the hypothenuse;
4. The sides about the right angle.

All these cases can be solved by the following Theorem :

## THEOREM I.

**90.** *In any right-angled plane triangle,*

- 1st. *The side opposite an acute angle is equal to the product of the sine of this angle and the hypothenuse.*
- 2d. *The side opposite an acute angle is equal to the product of the tangent of this angle and the side adjacent to this angle.*

---

\* Before beginning this chapter, the arrangement and use of the tables of Logarithmic Sines, Cosines, &c. must be learned from Arts. 32, 33, and 34.

Let A B C (Art. 92) be a triangle, right-angled at C.

$$\text{By (1)*} \quad \sin. A = \frac{a}{h} \quad \sin. B = \frac{b}{h} \quad (36)$$

$$\text{hence} \quad a = h \sin. A \quad b = h \sin. B \quad (37)$$

$$\text{By (2)} \quad \tan. A = \frac{a}{b} \quad \tan. B = \frac{b}{a} \quad (38)$$

$$\text{hence} \quad a = b \tan. A \quad b = a \tan. B \quad (39)$$

**91. Corollary.** As  $\sin. A = \cos. B$ , and  $\sin. B = \cos. A$

$$a = h \cos. B \quad b = h \cos. A \quad (40)$$

### CASE I.

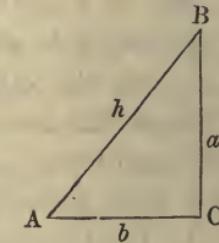

**92. Given the hypotenuse and an acute angle.**

By (37)\* and (40)

$$a = h \sin. A$$

$$b = h \cos. A$$

Ex. 1. Given  $h$  255, and A  $57^\circ 14'$ , to find  $a$  and  $b$ .

*By Logarithms.*

$$a = h \sin. A = \log. 255 + \log. \sin. A$$

h 255	2.406540
-------	----------

sin. A $57^\circ 14'$	9.924735
-----------------------	----------

a 214.42	2.331275
----------	----------

$$b = h \cos. A = \log. 255 + \log. \cos. A$$

h 255	2.406540
-------	----------

cos. A $57^\circ 14'$	9.733373
-----------------------	----------

b 138.01	2.139913
----------	----------

\*. In the Analytical Method these numbers standing alone in parentheses refer to the equations with the same number.

**93.** As the logarithmic sine, cosine, &c. of the tables are increased by 10 (Art. 32), the resulting logarithm must be diminished by 10 as often as these functions appear as factors.

**94.** In the cases that follow, where division is performed by logarithms, we add the complement. As the logarithmic sine, cosine, &c. of the tables are increased by 10, the resulting logarithm is the logarithm sought.

Ex. 2. Given  $h$  1676, A  $67^\circ 13'$ , to find  $a$  and  $b$ .

$$\text{Ans. } \begin{cases} a & 1545.23 \\ b & 649.03 \end{cases}$$

Ex. 3. Given  $h$  78.4, B  $15^\circ 51'$ , to find  $a$  and  $b$ .

$$\text{Ans. } \begin{cases} a & 75.42 \\ b & 21.41 \end{cases}$$

### CASE II.

**95.** Given a side about the right angle and an acute angle.

By (37)

$$a = h \sin. A$$

$$b = h \sin. B$$

Ex. 1. Given  $a$  195, B  $64^\circ 43'$ , to find  $b$  and  $h$ .

$a$ 195	2.290035
sin. A = cos. $64^\circ 43'$	comp. 0.369476
$h$ 456.57	2.659511
$h$	2.659511
sin. B $64^\circ 43'$	9.956268
$b$ 412.84	2.615779

Ex. 2. Given  $b$  1075, B  $75^\circ 49'$ , to find  $a$  and  $h$ .

$$\text{Ans. } \begin{cases} a & 271.68 \\ h & 1108.79 \end{cases}$$

Ex. 3. Given  $b$  17.45, A  $47^\circ 31'$ , to find  $a$  and  $h$ .

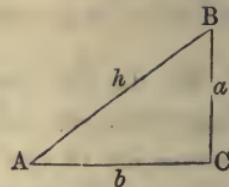

$$\text{Ans. } \begin{cases} a & 19.05 \\ h & 25.84 \end{cases}$$

## CASE III.

**96.** Given a side about the right angle and the hypotenuse.

By (36) and (37)

$$\begin{aligned}\sin. A &= \frac{a}{h} \\ b &= h \sin. B\end{aligned}$$

Ex. 1. Given  $h$  24.5,  $a$  17.4, to find the other parts.

$a$ 17.4	1.240549
$h$ 24.5	comp. 8.610834
sin. A $45^\circ 15' 5''$	<hr/> 9.851383

$$B = 90^\circ - 45^\circ 15' 5'' = 44^\circ 44' 55''$$

$h$ 24.5	1.389166
sin. B $44^\circ 44' 55''$	<hr/> 9.847571
$b$ 17.248	<hr/> 1.236737

Otherwise  $b$  can be found from the formula  $b^2 = h^2 - a^2$ .

$$\therefore b = \sqrt{(h + a)(h - a)}$$

Ex. 2. Given  $h$  172.8,  $b$  14.17, to find the other parts.

Ans.  $\left\{ \begin{array}{l} A 85^\circ 17' 47''. \\ B 4^\circ 42' 13''. \\ a 172.218. \end{array} \right.$

## CASE IV.

**97.** Given the sides about the right angle.

By (38) and (37)

$$\tan. A = \frac{a}{b}$$

$$h = \frac{a}{\sin. A}$$

Ex. 1. Given  $a$  195,  $b$  147, to find the other parts.

$a$ 195	2.290035
$b$ 147	comp. 7.832683
tan. A $52^\circ 59' 22''$	<hr/> 10.122718

$$B = 90^\circ - 52^\circ 59' 22'' = 37^\circ 0' 38''$$

a 195	2.290035
sin. A 52° 59' 22"	comp. 0.097712
h 244.2	2.387747

Otherwise  $h$  can be found from the formula  $h^2 = a^2 + b^2$ ; then the angles by (36).

Ex. 2. Given  $a$  189,  $b$  14, to find the other parts.

$$\text{Ans. } \begin{cases} A 85^\circ 45' 49''. \\ B 4^\circ 14' 11''. \\ h 189.518. \end{cases}$$

98. In the following Examples two parts of a right-angled triangle are given, and the others required.

$$1. \text{ Given } b 217, h 915. \quad \text{Ans. } \begin{cases} a 888.896. \\ A 76^\circ 16' 52''. \\ B 13^\circ 43' 8''. \end{cases}$$

$$2. \text{ Given } a 174, b 1927. \quad \text{Ans. } \begin{cases} A 5^\circ 9' 34''. \\ B 84^\circ 50' 26''. \\ h 1934.89. \end{cases}$$

$$3. \text{ Given } a 17.94, A 15^\circ 39'. \quad \text{Ans. } \begin{cases} b 64.038. \\ h 66.503. \end{cases}$$

$$4. \text{ Given } h 47.9, A 59^\circ 17'. \quad \text{Ans. } \begin{cases} a 41.1798. \\ b 24.467. \end{cases}$$

$$5. \text{ Given } a 298, h 744. \quad \text{Ans. } \begin{cases} A 23^\circ 36' 42''. \\ B 66^\circ 23' 18''. \\ b 681.712. \end{cases}$$

$$6. \text{ Given } a 9.75, b 13.44. \quad \text{Ans. } \begin{cases} A 35^\circ 57' 32''. \\ B 54^\circ 2' 28''. \\ h 16.60. \end{cases}$$

$$7. \text{ Given } b 0.02518, A 34^\circ 7' 10''. \quad \text{Ans. } \begin{cases} a 0.01706. \\ h 0.03042. \end{cases}$$

## OBlique-angled TRIANGLES.

**99.** In solving oblique-angled triangles, there are four cases. There may be given,

1. Two angles and a side;
2. Two sides and an angle opposite one of them;
3. Two sides and the included angle;
4. The three sides.

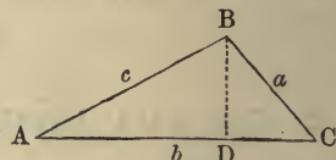

For solving these we demonstrate the three following Theorems.

## THEOREM II.

**100.** *In any plane triangle, the sides have the same ratio as the sines of the opposite angles.*

Let  $a, b, c$  represent the sides opposite the angles A, B, C, respectively. Then

$$a : b : c = \sin. A : \sin. B : \sin. C$$

From B draw BD perpendicular to  $b$ . Then ABD and BDC being right-angled triangles, by (37) we have

$$c \sin. A = BD = a \sin C$$

hence

$$a : c = \sin. A : \sin. C$$

In like manner it can be shown that

$$a : b = \sin. A : \sin. B$$

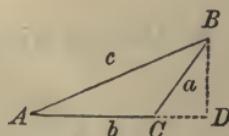

$$b : c = \sin. B : \sin. C$$

Therefore

$$a : b : c = \sin. A : \sin. B : \sin. C \quad (41)$$

**101.** If the perpendicular falls without the triangle, the angles  $B C A$  and  $B C D$ , being supplements of each other, have the same sine, and

$$B D = a \sin. B C D = a \sin. C$$

## THEOREM III.

**102.** In any plane triangle, the sum of any two sides is to their difference, as the tangent of half the sum of the opposite angles is to the tangent of half their difference.

Let A B C (Art. 103) be a plane triangle; then

$$a + c : a - c = \tan. \frac{1}{2}(A + C) : \tan. \frac{1}{2}(A - C)$$

By (41) we have

$$a : c = \sin. A : \sin. C$$

By composition and division (Geom. Pn. 19)

$$a + c : a - c = \sin. A + \sin. C : \sin. A - \sin. C$$

or

$$\frac{a + c}{a - c} = \frac{\sin. A + \sin. C}{\sin. A - \sin. C}$$

But by (25)

$$\frac{\sin. A + \sin. C}{\sin. A - \sin. C} = \frac{\tan. \frac{1}{2}(A + C)}{\tan. \frac{1}{2}(A - C)}$$

Therefore

$$\frac{a + c}{a - c} = \frac{\tan. \frac{1}{2}(A + C)}{\tan. \frac{1}{2}(A - C)}$$

$$\text{or } a + c : a - c = \tan. \frac{1}{2}(A + C) : \tan. \frac{1}{2}(A - C) \quad (42)$$

## THEOREM IV.

**103.** In any plane triangle, the cosine of any angle is equal to the sum of the squares of the two adjacent sides minus the square of the opposite side, divided by twice the product of the adjacent sides.

In the triangle A B C

$$CD = b - AD$$

$$CD^2 = b^2 - 2bAD + AD^2$$

Adding  $BD^2$  to both members, we have  
(Geom., II. 27)

$$a^2 = b^2 + c^2 - 2bAD$$

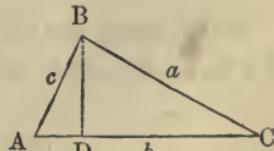

But by (40)

$$AD = c \cos. A$$

$$\therefore a^2 = b^2 + c^2 - 2bc \cos. A$$

Therefore

$$\cos. A = \frac{b^2 + c^2 - a^2}{2bc} \quad (43)$$

**104.** For greater convenience in using logarithms (43) can be changed by subtracting both members from unity and reducing, as follows :

$$\begin{aligned} 1 - \cos. A &= \frac{2 b c - b^2 - c^2 + a^2}{2 b c} = \frac{a^2 - (b - c)^2}{2 b c} \\ &= \frac{(a - b + c)(a + b - c)}{2 b c} \end{aligned} \quad (44)$$

But by (35)  $1 - \cos. A = 2 \sin^2 \frac{1}{2} A$

Substituting in (44) this value of  $1 - \cos. A$ , and also putting  $s = \frac{a + b + c}{2}$ , and reducing, we have

$$\left. \begin{aligned} \sin. \frac{1}{2} A &= \sqrt{\frac{(s - b)(s - c)}{b c}} \\ \text{In like manner} \\ \sin. \frac{1}{2} B &= \sqrt{\frac{(s - a)(s - c)}{a c}} \\ \sin. \frac{1}{2} C &= \sqrt{\frac{(s - a)(s - b)}{a b}} \end{aligned} \right\} \quad (45)$$

**105.** Adding both members of (43) to unity, we have

$$\begin{aligned} 1 + \cos. A &= \frac{2 b c + b^2 + c^2 - a^2}{2 b c} = \frac{(b + c)^2 - a^2}{2 b c} \\ &= \frac{(b + c + a)(b + c - a)}{2 b c} \end{aligned} \quad (46)$$

But by (35)  $1 + \cos. A = 2 \cos^2 \frac{1}{2} A$

Substituting in (46) this value of  $1 + \cos. A$ , and the value of  $s$  as in Art. 104, and reducing, we have

$$\left. \begin{aligned} \cos. \frac{1}{2} A &= \sqrt{\frac{s(s - a)}{b c}} \\ \text{In like manner} \\ \cos. \frac{1}{2} B &= \sqrt{\frac{s(s - b)}{a c}} \\ \cos. \frac{1}{2} C &= \sqrt{\frac{s(s - c)}{a b}} \end{aligned} \right\} \quad (47)$$

**106.** Dividing equations (45) by (47) in order, by means of (9) we have

$$\left. \begin{aligned} \tan. \frac{1}{2} A &= \sqrt{\frac{(s-b)(s-c)}{s(s-a)}} \\ \tan. \frac{1}{2} B &= \sqrt{\frac{(s-a)(s-c)}{s(s-b)}} \\ \tan. \frac{1}{2} C &= \sqrt{\frac{(s-a)(s-b)}{s(s-c)}} \end{aligned} \right\} \quad (48)$$

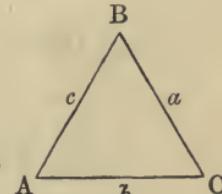

## CASE I.

**107.** Given two angles and a side.

By (41)

$$\sin. A : \sin. B : \sin. C = a : b : c$$

Ex. 1. Given A  $48^\circ$ , C  $55^\circ 17'$ , a 417, to find the other parts.

$$B = 180^\circ - (55^\circ 17' + 48^\circ) = 76^\circ 43'$$

sin. A $48^\circ$	comp. 0.128927
: sin. B $76^\circ 43'$	9.988223
$= a$ 417	<u>2.620136</u>
: b 546.12	2.737286
sin. A $48^\circ$	comp. 0.128927
: sin. C $55^\circ 17'$	9.914860
$= a$ 417	<u>2.620136</u>
: c 461.24	2.663923

Ex. 2. Given A  $95^\circ 4'$ , B  $25^\circ 14'$ , c 49.17, to find the other parts.

Ans.  $\left\{ \begin{array}{l} C 59^\circ 42' \\ a 56.727 \\ b 24.278 \end{array} \right.$

## CASE II.

**108.** Given two sides and an angle opposite to one of them.

By (41)

$$a : b : c = \sin. A : \sin. B : \sin. C$$

Ex. 1. Given  $a$  55,  $c$  49.87,  $A$   $25^\circ 44'$ , to find the other parts

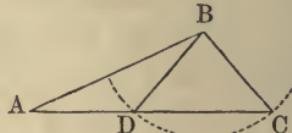

$a$ 55	comp. 8.259637
$: c$ 49.87	1.697839
$= \sin. A$ $25^\circ 44'$	9.637673
$: \sin. C$ $23^\circ 11' 2''$	9.595149

$$B = 180^\circ - (23^\circ 11' 2'' + 25^\circ 44') = 131^\circ 4' 58''$$

$\sin. C$ $23^\circ 11' 2''$	comp. 0.404851
$: \sin. B$ $131^\circ 4' 58''$	9.877234
$= c$ 49.87	1.697839
$: b$ 95.483	1.979924

**109.** If  $BC$ , the side opposite the given angle, is less than the other given side  $AB$ , and the given angle is acute, there are two triangles which

satisfy the conditions, viz.  $ABC$  and  $ABD$ , in which the angles  $BCA$  and  $BDA$  are supplements of each other. The Log. sine obtained in working such an example represents either the angle  $BCA$ , or its supplement  $BDA$  (Art. 80). If the given angle  $A$  is obtuse, or the side opposite the given angle is greater than the other given side, there is but one solution (Geom., VI. 11). Whenever the solution is impossible (Geom., VI. 12), the Log. sine obtained in working the example will be greater than unity (10. in the tables), which is impossible (Art. 58).

Ex. 2. Given  $a$  95.5,  $c$  173.2,  $A$   $27^\circ 4'$ , to find the other parts.

$$\text{Ans. } \begin{cases} C 55^\circ 36' 47'', \\ B 97^\circ 19' 13'', \\ b 208.17, \end{cases} \text{ or } \begin{cases} C 124^\circ 23' 13'', \\ B 28^\circ 32' 47'', \\ b 100.29. \end{cases}$$

## CASE III.

**110.** *Given two sides and the included angle.*

By (42)

$$a + c : a - c = \tan. \frac{1}{2}(A + C) : \tan. \frac{1}{2}(A - C)$$

By (41)

$$\sin. A : \sin. B : \sin. C = a : b : c$$

Ex. 1. Given  $a$  976,  $c$  89,  $B$   $51^\circ 17'$ , to find the other parts.

$$\begin{aligned} \frac{1}{2}(A + C) &= \frac{1}{2}(180^\circ - 51^\circ 17') = 64^\circ 21' 30'' \\ a + c &= 1065 & \text{comp. } 6.972650 \\ : a - c &= 887 & 2.947924 \\ &= \tan. \frac{1}{2}(A + C) = \tan. 64^\circ 21' 30'' & 10.318746 \\ &: \tan. \frac{1}{2}(A - C) = \tan. 60^\circ 2' 36'' & 10.239320 \end{aligned}$$

Half the sum plus half the difference gives the greater angle  $A$   $124^\circ 24' 6''$ ; half the sum minus half the difference, the less  $C$   $4^\circ 18' 54''$ .

$$\begin{aligned} \sin. C 4^\circ 18' 54'' && \text{comp. } 1.123553 \\ : \sin. B 51^\circ 17' && 9.892233 \\ = c 89 && 1.949390 \\ : b 922.94 && 2.965176 \end{aligned}$$

Ex. 2. Given  $a$  91,  $b$  104,  $C$   $14^\circ 30'$ , to find the other parts.

$$\text{Ans. } \begin{cases} A 55^\circ 5' 37'', \\ B 110^\circ 24' 23'', \\ c 27.783. \end{cases}$$

## CASE IV.

**111.** Given the three sides.

By (48)

$$\tan. \frac{1}{2} A = \sqrt{\frac{(s - b)(s - c)}{s(s - a)}}$$

$$\tan. \frac{1}{2} B = \sqrt{\frac{(s - a)(s - c)}{s(s - b)}}$$

$$\tan. \frac{1}{2} C = \sqrt{\frac{(s - a)(s - b)}{s(s - c)}}$$

**Ex. 1.** Given  $a$  125,  $b$  135,  $c$  75, to find the angles.

$s$ 167.5	comp. 7.775985	comp. 7.775985	comp. 7.775985
$s - a$ 42.5	comp. 8.371611	1.628389	1.628389
$s - b$ 32.5	1.511883	comp. 8.488117	1.511883
$s - c$ 92.5	1.966142	1.966142	comp. 8.033858
	2) 19.625621	2) 19.858633	2) 18.950115
Log. tangents	9.8128105	9.9293165	9.4750575
	$\frac{1}{2} A$ 33° 1' 3.6"	$\frac{1}{2} B$ 40° 21' 28.3"	$\frac{1}{2} C$ 16° 37' 28.1"
	A' 66° 2' 7.2"	B 80° 42' 56.6"	C 33° 14' 56.2"

**112.** The angles can also be obtained from formula (45) or (47). As the sines differ from each other more for angles between 0° and 45°, the cosines for angles between 45° and 90°, (45) is preferable when the half-angle is less than 45°, and (47) when the half-angle is more than 45°. But (48) is more accurate for all angles, and requires but four logarithms.

**113.** The sum of any two sides must be greater than the remaining side, otherwise the triangle is impossible.

**Ex. 2.** Given  $a$  347,  $b$  542,  $c$  476, to find the angles.

$$\text{Ans. } \left\{ \begin{array}{l} A 39^\circ 11' 14''.5 \\ B 80^\circ 43' 43''.5 \\ C 60^\circ 5' 2'' \end{array} \right.$$

For Miscellaneous Examples see page 28.

## CHAPTER VI.

## PRACTICAL APPLICATIONS.

## DEFINITIONS.

**114.** A **Horizontal Plane** is a plane which is tangent to the earth's surface, and every line in this plane is a *horizontal line*.

**115.** A **Vertical Line** is a line which is perpendicular to a horizontal plane, and every plane including in its surface such a line is a *vertical plane*.

**116.** A **Horizontal Angle** is one that has the plane of its sides horizontal.

**117.** A **Vertical Angle** is one that has the plane of its sides vertical.

**118.** An **Angle of Elevation** is a vertical angle having one side horizontal, and the inclined side above it ; as C A B (Art. 120).

**119.** An **Angle of Depression** is a vertical angle having one side horizontal, and the inclined side below it ; as F B A.

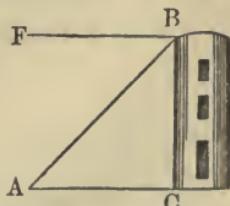

## HEIGHTS AND DISTANCES.

## PROBLEM I.

**120.** To determine the height of a vertical object standing on a horizontal plane..

Suppose it is required to find the height of B C.

From the foot of B C measure any convenient distance C A, and at A take the angle of elevation C A B. Then, in the right-angled triangle A B C, all the angles and the side A C are known, and B C can be found.

**121. Second Method.** Without measuring the angle of elevation,  $\angle CAB$ , the height of  $BC$  may be found, as follows :

Cut a stake equal in length to the distance of your eye from the ground ; move away from  $BC$ , until, by taking the position  $AD$ , with your head at  $A$  and the stake  $DE$  standing perpendicular at your feet, you can just see, in a line with the top of the stake, the top of the object.

Then, since  $AD$  is equal to  $DE$ ,  $AC$  is equal to  $CB$  (Geom. II. 20) ; and if  $AC$  is measured,  $CB$  becomes known.

This method is used in finding the heights of trees, or the length of that part of the tree which is fit for timber.

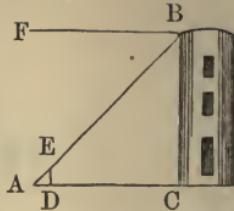

**122. Third Method.** When shadows are cast by objects, still another method can be used.

Measure the height of any convenient vertical object and the length of its shadow, and also the length of the shadow of the object whose height is sought. Then (Geom. II. 20) the length of the shadow of the one is to its height as the length of the shadow of the other to its height.

**123.** If the height  $BC$  is known, by taking any position, as  $A$ , and measuring the angle  $BAC$ , the distance  $AC$  can be found.

**124.** If from the top of the tower the angle of depression  $FBA$ , which is equal to  $BAC$ , is taken, then, if  $BC$  is known,  $AC$  can be found ; if  $AC$  is known,  $BC$  can be found.

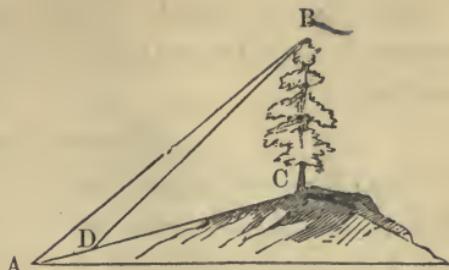

Ex. 1. The distance  $AC$  is 100 feet, and the angle  $BAC$   $41^\circ 15'$  ; what is the height of the tower ?      Ans. 87.6976 ft.

## PROBLEM II.

**125.** To find the height of a vertical object standing on an inclined plane.

Measure any convenient distance from the object, as  $CD$ , and the angles of elevation of both  $DC$  and  $DB$ . Then all the angles, and the side  $DC$ , of the triangle  $DBC$ , are known, and  $AC$  can be found.

Ex. 1. If  $DC$  is 55 feet, and the angle of elevation of  $DC$  is  $10^\circ$ , and of  $DB$   $36^\circ$ , what is the height of the tree?

$$\text{Angle } BDC = 36^\circ - 10^\circ = 26^\circ$$

$$\text{Angle } DBC = 90^\circ - 36^\circ = 54^\circ$$

Ans. 29.8 ft.

**126. Second Method.** If two stations be taken in the line  $AC$ , as  $A$  and  $D$ , and the distance  $AD$  and the angles of elevation of  $AB$ ,  $DB$ , and  $DC$  are measured, then in the triangle  $ABD$  all the angles and the side  $AD$  are known, and  $BD$  can be found; then in the triangle  $BDC$  all the angles and the side  $BD$  are known, and  $BC$  and  $CD$  can be found.

Ex. 2. If  $AD$  is 11.5 feet, and the angle of elevation of  $AB$   $38^\circ$ , of  $DB$   $41^\circ$ , and of  $DC$   $9^\circ$ , what is the height of the tree?

$$\text{Angle } BAD = 29^\circ, BDC = 32^\circ, ABD = 3^\circ, BCD = 99^\circ.$$

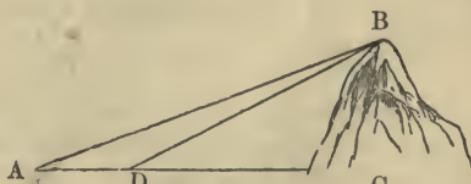

Ans. 57.156 ft.

*Solve C - 99  
- A - 32  
- D - 108.6*

### PROBLEM III.

**127. To find the height of an inaccessible object above a horizontal plane.**

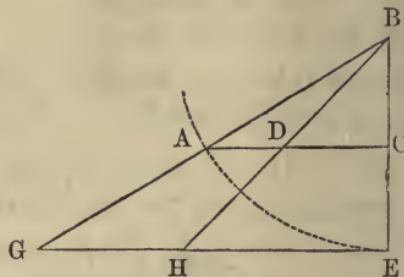

The first method is precisely the same as the last method in Prob. II., the angle of elevation of  $AD$  being  $0^\circ$ .

**128. Second Method.** RULE. Divide the distance between the stations by the difference of the natural cotangents of the angles of elevation.

DEMONSTRATION.\*

With B as the centre, and BA as radius, describe the arc AE; produce BC till it meets the arc at E; at the point E draw EG tangent to the arc, and produce BD and BA to H and G.

$$AD : GH = BD : BH = BC : BE$$

$$AD : GH = BC : BE$$

$$BC = \frac{BE \times AD}{GH}$$

But BE is radius or unity, and GH is the difference between the tangents of the angles GB E and HB E, that is, between the cotangents of BAC and BDC :

$$\therefore BC = \frac{AD}{\cot. BAC - \cot. BDC}$$

Ex. 1. If the distance AD is 97 feet, and the angles of elevation of AB and DB are respectively  $37^\circ 22'$  and  $56^\circ 10'$ , what is the height BC?

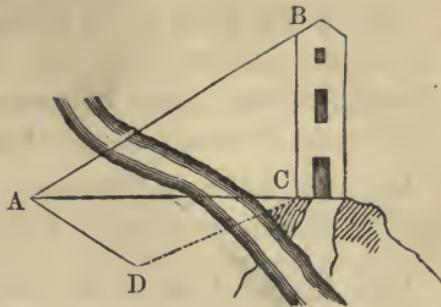

† $\cot. 37^\circ 22'$	1.30952
$\cot. 56^\circ 10'$	0.67028
<hr style="width: 40%; margin-left: 0; border: 0.5px solid black;"/>	
0.63924) 97.00000 (151.7 ft. Ans.	

**129. Third Method.** Measure any base line AD, and the

$$\begin{aligned} * \text{Analytical. } AC &= BC \tan. ABC & DC &= BC \tan. DBC \\ \therefore AC - DC &= AD = BC (\tan. ABC - \tan. DBC) \\ BC &= \frac{AD}{\cot. BAC - \cot. BDC} \end{aligned}$$

† To find the Nat. Cot. from the Log. Tables subtract 10 from the characteristic of the Log. Cot., and then find its corresponding natural number from the Table of Logarithms.

horizontal angles CAD and CDA, and the vertical angle CAB. Then, in the triangle ACD, we have one side and all the angles, and AC can be found; then, in the right-angled triangle ABC, we have one side and all the angles, and the height BC can be found.

Ex. 2. At the point A, I took the angle of elevation of the top of the tower BC  $34^\circ 45'$ ; then, turning at a right angle, I measured off AD 40 feet, and measured the angle ADC  $58^\circ$ . What is the height of the tower?

Ans. 44.4 ft.

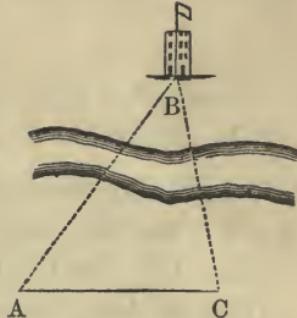

#### PROBLEM IV.

**130.** *To find the distance of an inaccessible object.*

Measure a horizontal base line AC, and the angles BAC and ACB. Then, in the triangle ABC, we have one side and all the angles, and AB or CB can be found.

Ex. 1. If AC is 20 chains, the angle A  $25^\circ$ , and C  $92^\circ$ , what is the distance AB?

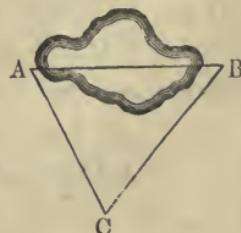

Ans. 22.43 chs.

#### PROBLEM V.

**131.** *To find the distance between two objects separated by an impassable barrier.*

Take any station C, from which both A and B are visible and accessible. Measure the angle ACB, and the sides AC and CB. Then, in the triangle ABC, we have two sides and the included angle, to find the third side AB.

**132.** If the point A can be seen at B, the angle A B C can also be measured, and then only one side, A C or C B, whichever is most convenient, need be measured. Then, in the triangle ABC, we have one side and all the angles, and A B can be found.

Ex. 1. If A C is 44.4 chains, C B 50 chains, and the angle C  $39^{\circ} 25'$ , what is the distance A B? Ans. 32.268 chs.

**133.** If there is an elevated object, whose height is known, in the line A B produced, from which the points A and B can both be seen, by taking the angles of depression of A and B, the distance A B can be found by a rule the reverse of that given in Art. 128, viz.: *Multiply the difference of the natural cotangents of the angles of depression by the height of the object.*

Ex. 2. Wishing to know the width of a river, from the top of a tower 197 feet above the level of the river, I found the angle of depression of the nearer edge  $54^{\circ} 10'$ , of the farther  $48^{\circ} 37'$ ; what was the width of the river? Ans. 31.3 ft.

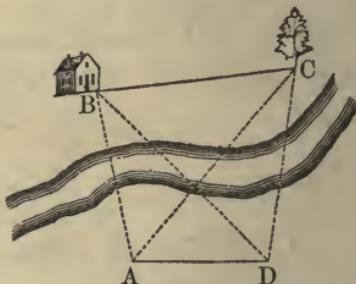

#### PROBLEM VI.

**134.** To find the distance between two inaccessible objects.

Measure any convenient base line A D, and the angles B A D, B D A, C D A, and C A D.

Then, in the triangle A B D, we have all the angles and the side A D, and B D can be found. In the triangle A C D we have all the angles and the side A D, and C D can be found. Then, in the triangle B C D, the two sides B D and D C and the included angle are known, and B C, the distance required, can be found.

Ex. 1. If A D is 40 rods long, the angle B A D  $100^{\circ}$ , A D B  $51^{\circ}$ , C D A  $120^{\circ}$ , and C A D  $55^{\circ}$ , what is the distance between B and C? Ans. 355.05 rds.

## PROBLEM VII.

**135.** To find the distances, from a given point, of three objects whose distances from each other are known.

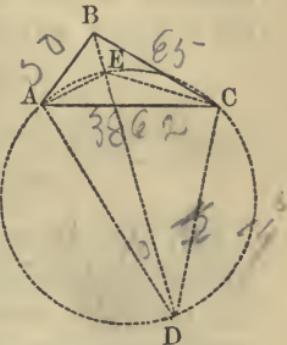

Let D be the given point, and A, B, C three points whose distances from each other are known; it is required to find the distance from D to the several points. The angles ADB and BDC must be measured. Then describe a circumference through the three points A, D, C; draw AB, BC, AC, AD, BD, CD; from A and C draw lines to E, the point where BD cuts the circumference. In the triangle AEC the side AC is given, and all the angles are known; for  $\angle ECA = \angle EDA$ , and  $\angle CAE = \angle CDE$  (Geom., III. 22); therefore AE can be found.

In the triangle ABC, the three sides being given, the three angles can be found. Then, in the triangle ABE, we know the sides AB, AE, and the included angle BAE ( $= \angle BAC - \angle EAC$ ), and the angle ABE can be found. Then, in the triangle ABD, all the angles become known, and the side AB is given; therefore AD and BD can be found; then CD can also be found.

**136.** If the point B is between D and the line AC, the angle  $\angle BAE = \angle BAC + \angle EAC$ . But in this case the distances AB and BC cannot be the same as when B is beyond the line AC, unless BD cuts AC at right angles.

If, however, BD cuts AC at right angles, and the position of B is not known, though the distances of A and C from D can be found, the distance of B will be ambiguous; B may be in either of two points in the line BD.

If the angle B is the supplement of ADC, the point B will fall on E, and  $\angle BCA = \angle BDA$  and  $\angle CAB = \angle CDB$ . In this case D may be anywhere in the arc ADC, and the distances

A D, B D, C D cannot be determined from the data given. Also, if A, B, C, D are in the same straight line, the distances cannot be determined.

Ex. 1. If A B (Fig. Art. 135) is 50, B C 65, A C 38.62 chains in length, the angle A D B  $10^\circ$ , B D C  $12^\circ 14'$ , what are the distances A D, B D, C D? *never used*

Ans. A D 100, B D 145.37, C D 84.828 chs.

### DETERMINATION OF AREAS.

**137.** The Areas of triangles, parallelograms, and trapezoids, when their altitudes are given, can be found by application of the principles already demonstrated in Geometry. But by Trigonometry the areas of these polygons can be found when in the triangle and parallelogram, in place of the base and altitude, two adjacent sides and an angle, and in the trapezoid the sides and two opposite angles, are given.

#### PROBLEM I.

**138.** To find the area of a parallelogram. =

RULE I. Multiply the base by the altitude. (Geom., II. 10.)

Ex. 1. How many square yards are there in the sides, floor, and ceiling of a rectangular room, 20 feet long, 16 feet wide, and 10 feet high?

**139.** If two adjacent sides and an angle are given, the area can be found by

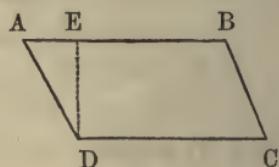

RULE II. Multiply together the two adjacent sides and the sine of the included angle.

For, by Theorem I.,

$$ED = AD \times \sin. A$$

$$\text{Area} = AB \times ED = AB \times AD \times \sin. A$$

If the work is done by logarithms, ten must be taken from the index of the log. sine. (Art. 32.)

Ex. 2. What is the area of a parallelogram whose adjacent sides are 475 and 355 feet, and the included angle  $49^\circ$ ? - ~~987778~~

## PROBLEM II.

**140.** *To find the area of a triangle.*

RULE I. *Multiply one half the base by the altitude.* (Geom., II. 11.)

**141.** As a triangle is half a parallelogram of the same base and altitude, when two sides and the included angle are given, the area can be found (139) by

RULE II. *Multiply together the two sides and half the sine of the included angle.*

Ex. 1. What is the area of a triangle whose two sides are 75 and 14 rods, and the included angle  $71^\circ$ ? ~~7.975670~~

**142.** When the three sides are given, an angle can be found, and then the area by the last rule; or, without finding an angle, the area can be found by the following rule :

RULE III. *From half the sum of the three sides subtract successively the three sides; multiply together these three remainders and the half-sum, and extract the square root of the product.*

Let  $a$ ,  $b$ ,  $c$  denote respectively the sides opposite the angles A, B, C.

$$DC = AC - AD$$

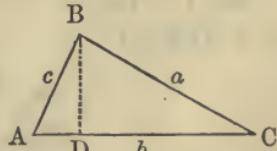

$$DC^2 = AC^2 - 2AC \times AD + AD^2$$

Adding  $BD^2$  to both members, by Geom., II. 27, we have

$$BC^2 = AC^2 + AB^2 - 2AC \times AD$$

or  $a^2 = b^2 + c^2 - 2b \times AD$

$$\therefore AD = \frac{b^2 + c^2 - a^2}{2b}$$

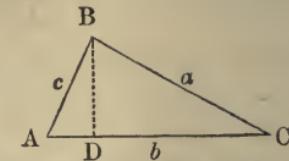

But (Geom., II. 28)  $B D^2 = A B^2 - A D^2$

$$\therefore B D^2 = c^2 - \left( \frac{b^2 + c^2 - a^2}{2b} \right)^2$$

$$= \frac{4b^2c^2 - (b^2 + c^2 - a^2)^2}{4b^2}$$

and  $B D = \sqrt{\frac{4b^2c^2 - (b^2 + c^2 - a^2)^2}{4b^2}}$

$$\text{Area} = \frac{AC \times BD}{2} = \frac{b}{2} \sqrt{\frac{4b^2c^2 - (c^2 + a^2 - b^2)^2}{4b^2}}$$

$$= \sqrt{\frac{4b^2c^2 - (b^2 + c^2 - a^2)^2}{16}}$$

As the product of the sum and difference of two quantities is equal to the difference of their squares, we have

$$4b^2c^2 - (b^2 + c^2 - a^2)^2 = (2bc - [b^2 + c^2 - a^2]) \times (2bc + [b^2 + c^2 - a^2])$$

But

$$2bc - (b^2 + c^2 - a^2) = a^2 - (b^2 - 2bc + c^2) = a^2 - (b - c)^2$$

and

$$a^2 - (b - c)^2 = (a + [b - c]) \times (a - [b - c]) = (a + b - c) \times (a + c - b)$$

and so also

$$2bc + (b^2 + c^2 - a^2) = (b + c)^2 - a^2 = (b + c - a) \times (b + c + a)$$

$$\therefore \text{Area} = \sqrt{\frac{(a + b + c) \times (b + c - a) \times (a + c - b) \times (a + b - c)}{16}}$$

Putting

$$s = \frac{a + b + c}{2}$$

we have  $\text{Area} = \sqrt{s(s - a)(s - b)(s - c)}$

Ex. 1. What is the area of a triangle whose sides are 45, 55, and 60 feet?

$$s = \frac{160}{2} = 80 \text{ Log. } 1.903090$$

$$80 - 45 = 35 \text{ " } 1.544068$$

$$80 - 55 = 25 \text{ " } 1.397940$$

$$80 - 60 = 20 \text{ " } 1.301030$$

$$2) \underline{6.146128}$$

$$3.073064$$

Ans. 1183.2 sq. ft.

## PROBLEM III.

**143.** *To find the area of a trapezoid.*

RULE I. *Multiply half the sum of the parallel sides by the perpendicular distance between them.*

**144.** If the angles are known, we can use

RULE II. *Divide the trapezoid by a diagonal, and find the area of each triangle (141); their sum will be the area required.*

**145.** If the length of the diagonal is known, the area of these triangles may be found by (142).

This rule applies equally well to a trapezium.

Ex. 1. Find the area of a trapezoid whose parallel sides are 97 and 84, and the perpendicular distance between them 47 feet. = 4132 1/2

Ex. 2. Find the area of a figure whose four sides are successively 27, 77, 28, and 85 rods in length, the angle between the first and second side  $93^\circ$ , and between the third and fourth  $76^\circ 15'$ . Ans. 13 acres, 2 rods, 33.97 sq. rds.

Ex. 3. Find the area of a trapezium whose sides are successively 35.8, 13.32, 35.84, and 17.8 rods, and the line from the beginning of the first to the end of the second side 38.9 rods.

Ans. 3 acres, 1 rood, 36.25+ sq. rds.

## PROBLEM IV.

**146.** *To find the area of any polygon.*

If the diagonals necessary to divide the figure into triangles have been measured, the area can be found by finding the sum of the areas of the several triangles.

When these diagonals are not known, the method generally used is called the *rectangular method*. The exposition of this method belongs more properly under the head of surveying.

## MISCELLANEOUS EXAMPLES.

1. The distance up the inclined surface of a hill whose angle of elevation is  $7^\circ$ , is 25 rods; the hill descends on the other side to the same level, with an inclination of  $15^\circ$ . How many pickets three inches wide, placed three inches apart, will it take to build a fence over the hill ?  
Ans. 1194.
2. Having measured a horizontal line from the base of a vertical tower to the distance of 160 feet, I find that the angle of elevation of the top of the tower is  $21^\circ$ . What is the height of the tower ?  
Ans. 61.418 ft.
3. Having measured from the base of a hill, whose inclination is  $65^\circ$ , 25 rods on a horizontal plane, I find that the angle of elevation of the top is  $16^\circ 25'$ . What is the altitude of the hill above the horizontal plane ?  
Ans. 8.538 rds.
4. Two observers, A and B, at sea, a mile apart, take at the same time the angles of elevation of a meteor which appears due west of each. A finds the angle  $21^\circ 50'$ , B  $19^\circ 30'$ . What is its altitude ?  
Ans. 3.049 ms.
5. From a steeple 65 feet above the level of an adjacent pond, the angle of depression of one edge is  $40^\circ 10'$ , of the other  $21^\circ 30'$ . What is the width of the pond, and its distance from the church ?  
Ans. Width 88 ft., distance 77 ft.
6. When a tree 25 feet high casts a shadow 100 feet long, what is the sun's altitude ?  
Ans.  $14^\circ 2' 10''$ .
7. From the base of a tower, the angle of elevation of the top of a second tower is  $30^\circ$ , and from the top of the first, which is 175 feet high, the angle of depression of the top of the second is  $10^\circ$ . If both stand on the same horizontal plane, what is the height of the second ?  
Ans. 134.05 ft.
8. In the ruins of Persepolis there stand two upright col-

"Morning Morning -  
Apr 5 - 66 1886

umns, one 64, the other 50 feet above the plane; in a line between these, on the same plane, stands a statue, whose head is 86 feet from the summit of the lower, and 97 feet from that of the higher column, and the distance from the foot of the lower column to the centre of the base of the statue is 76 feet. What is the distance between the tops of the columns?

Ans. 157.03 ft. X

9. If the horizontal parallax of the sun, that is, the angle at the centre of the sun, subtended by the radius of the earth (3962 miles) is  $8''.5776$  (log. sine 5.6189407) what is the distance of the sun from the earth? Ans. 95273760.9 ms.

10. If the angle at the earth, subtended by the sun's diameter, is  $32'$ , and the distance as above, what is the diameter of the sun? Ans. 886845.5 ms.

11. If the moon's horizontal parallax is  $57' 9''$ , what is its distance from the earth? Ans. 238341.8 ms.

12. If the moon subtends an angle at the earth of  $31' 7''$ , and its distance is as above, what is its diameter?

Ans. 2157+ ms.

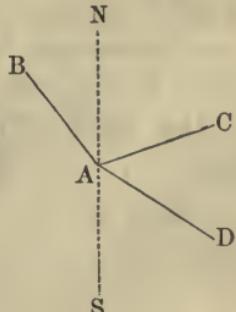

13. If the annual parallax, that is, the angle at the object, subtended by the radius of the earth's orbit, of the nearest fixed star ( $\alpha$  Centauri) is nearly  $1''$  (log. sine 4.685575), what is its minimum distance? Ans. 19650000000000.

**147.** The angle which a line makes with the meridian is called the *bearing* of the line. Thus, if NS is the meridian and the angle NAB  $40^\circ$ , NAC  $75^\circ$ , SAD  $45^\circ$ , the bearing is of

AB, N.  $40^\circ$  W., or of BA, S.  $40^\circ$  E.

AC, N.  $75^\circ$  E., or of CA, S.  $75^\circ$  W.

AD, S.  $45^\circ$  E., or of DA, N.  $45^\circ$  W.

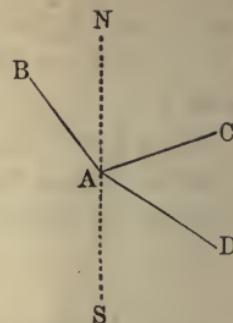

When the bearing of two lines which form an angle is given it is easy to find by inspection the number of degrees in the angle. Thus, the angle

$$\text{B A C} = 40^\circ + 75^\circ = 115^\circ$$

$$\text{B A D} = 40^\circ + (180 - 45^\circ) = 175^\circ$$

$$\text{C A D} = 180^\circ - 75^\circ - 45^\circ = 60^\circ$$

14. Having run a line 85 rods S.  $45^\circ$  E., I came to an impassable marsh, and, sending a man round to the other side of the marsh, I placed him exactly in the line; then, running N.  $20^\circ$  E. 20 rods, I found that the bearing of the man was S.  $24^\circ$  E.; then, going to the man, I ran the line (S.  $45^\circ$  E.) to the corner 44 rods farther. What is the whole length of the line?

Ans. 167.76 rds.

15. Wishing to find the distance between two objects just visible in the distance, I measured a base line 100 rods due east, and, at the west end of the line, found the bearing of both objects; one N.  $17^\circ$  W., the other N.  $45^\circ$  E.; at the other end, one N.  $23^\circ 30'$  W., the other N.  $40^\circ$  E. What is the distance?

Ans. 871.92 rds.

16. Coming into a harbor I observed a tower, eastward of it a steeple, and still farther eastward a cliff. The bearing of the tower was found to be N.  $17^\circ$  E., of the steeple N.  $20^\circ$  E., and of the cliff N.  $26^\circ 30'$  E. From a chart, the three objects were found to be in one straight line; from the tower to the steeple the distance was set down as 25 rods, and from the steeple to the cliff  $54\frac{7}{10}$  rods. What is my distance from each object?

Ans. Tower, 477.68 rods.; steeple, 477.06 rods.; cliff, 480.2 rods.

Sola L. Canfield

Feb. 21<sup>st</sup> 1886-

**LOGARITHMIC  
SINES AND TANGENTS,**

**FOR**

**EVERY DEGREE AND MINUTE**

**OF THE QUADRANT.**

---

The minutes in the left-hand column of each page, increasing downward, belong to the degrees at the top; and those increasing upward, in the right-hand column, belong to the degrees below.

Mond<sup>ay</sup> night  
March 27<sup>th</sup> 1886
